

Liebert[®] IntelliSlot[™] Modbus and BACnet Protocols

Reference Guide

Modbus RTU and TCP, BACnet MSTP and IP Protocols

The information contained in this document is subject to change without notice and may not be suitable for all applications. While every precaution has been taken to ensure the accuracy and completeness of this document, Vertiv assumes no responsibility and disclaims all liability for damages result from use of this information or for any errors or omissions.

Refer to local regulations and building codes relating to the application, installation, and operation of this product. The consulting engineer, installer, and/or end user is responsible for compliance with all applicable laws and regulations relation to the application, installation, and operation of this product.

The products covered by this instruction manual are manufactured and/or sold by Vertiv. This document is the property of Vertiv and contains confidential and proprietary information owned by Vertiv. Any copying, use, or disclosure of it without the written permission of Vertiv is strictly prohibited.

Names of companies and products are trademarks or registered trademarks of the respective companies. Any questions regarding usage of trademark names should be directed to the original manufacturer.

Technical Support Site

If you encounter any installation or operational issues with your product, check the pertinent section of this manual to see if the issue can be resolved by following outlined procedures.

Visit <https://www.vertiv.com/en-us/support/> for additional assistance.

1 Vertiv™ Liebert® Equipment Compatibility

1.1 Connectivity to Liebert®

Using Modbus RTU, Modbus TCP, BACnet MSTP or BACnet IP

This document describes the Modbus and BACnet communications protocols available for communication with Vertiv equipment. Included are the IntelliSlot™ Modbus and BACnet Protocols Modbus RTU, Modbus TCP, BACnet MSTP and the BACnet IP communications cards.

- The Modbus information includes implementation basics, supported types, frame format, function code support and similar subjects.
- The BACnet information includes the BACnet service listing, object types, device objects, analog objects, binary objects, multistate objects and BACnet engineering units.

NOTE: Some Modbus and BACnet Building Management Systems can be configured to send continuous updates for device setpoints, usually setting the same value. The BMS should be configured to send, on a sustained average, no more than two writes and two reads per second to the device. This will allow the device to catch up after a burst of updates when required while allowing other communication with the device to proceed.

The Vertiv™ Liebert® NX 225-600kVA UPS uses the Vertiv™ Chloride® Manage UPS Net Adapter +B card for Modbus support with the UPS' native processor. If the UPS is upgraded to use the optional MUND control board, then the Vertiv™ Liebert® IS-UNITY-DP card may be used to provide both Modbus and BACnet support. Both sets of mapping tables are provided in this document and referenced in [Liebert® Equipment and Compatible Liebert® IntelliSlot™ Card Modbus RTU & Modbus TCP Protocols](#) on the next page and [Liebert® Equipment and Compatible Liebert® IntelliSlot™ Cards BACnet MSTP & BACnet IP Protocols](#) on page 11

1.1.1 How to Use This Reference Guide

[Liebert® Equipment and Compatible Liebert® IntelliSlot™ Card Modbus RTU & Modbus TCP Protocols](#) on the next page, show the type of Vertiv™ Liebert® IntelliSlot™ card required for COMPLETE THIS selected products. Find the product first and the tables to reference; the columns to the right list the cards supported for the product.

The information is organized by Product Name, Table Number, Controller Protocol and Card Part Number.

Modbus tables are first and BACnet tables second, with products in the following sections:

- Thermal Management Products
- Power Distribution and Power Conditioning Products
- UPS Systems
- Battery Monitoring Products

2 Modbus Communications

2.1 Implementation Basics

Modbus protocol provides control and data acquisition, through query and response, between Primary and Secondary devices. This protocol comprises the rules for communication, controlling the message format between devices, how Primary and Secondary devices initiate communications, as well as unit identification, message handling and error checking.

The Vertiv™ Liebert® 485/IP card acts as a Secondary device on a network. This network can be a multidrop configuration over EIA-485, where multiple Secondary reside on a common wire or loop.

2.2 Transmission Format

The Liebert® IntelliSlot™ 485/IP interface card supports Modbus Remote Terminal Unit (RTU) transmission modes.

Table 2.1 Modbus Remote Terminal Unit settings for IntelliSlot™ Modbus and BACnet Protocols 485/IP interface card

Physical Port	Transmission Mode	Baud Rate	Data Bits	Parity Bits	Stop Bits	Start Bits
EIA-485/422 2-wire	RTU	9600, 19200 or 38400	8	None	1	1

2.3 Modbus Packet Format

Each Modbus packet consists of these fields:

- Device Address
- Function Code
- Data Field(s)
- Error Check Field

2.3.1 Device Address

The address field immediately follows the beginning of the frame and consists of 8-bits (RTU). This bit indicates the user assigned address of the Secondary device that is to receive the message from the attached Primary device.

Each Secondary device must be assigned a unique address. Only the addressed secondary device will respond to a query that contains its address.

2.3.2 Function Code

The function code field tells the addressed Secondary devices what function to perform. Function codes are designed to invoke a specific action by the Secondary device. The function code ranges from 1 to 127.

Table 2.2 Supported Modbus function codes

Code	Function	Description
01	Read Coils	Read from 1 to 2000 contiguous status of coils managed by the server. Coils in the response message are packed as one per bit of a byte, 1=On and 0=Off. If the requested quantity of coils is not a multiple of 8, zeros are padded in the final byte.
02	Read Discrete Inputs	Read from 1 to 2000 contiguous input status managed by the server. Discrete inputs in the response message are packed as one per bit of a byte, 1=On and 0=Off. If the requested number of inputs is not a multiple of 8, zeros are padded in the final byte.
03	Read Holding Registers	Read the contents of contiguous block of 1 to 127 holding registers. Data are packed as 2 bytes per register; the first byte contains the high order bits.
04	Read Input Registers	Read the contents of contiguous block of 1 to 127 Input registers. Data are packed as two bytes per register; the first byte contains the high order bits.
05	Force Single Coil	Write a single output to either On (1) or Off (0) mapped in coil section.
06	Write Single Register	Write a value into a single holding register;
15	Force Multiple Coils	Write On or Off. to a sequence of coils.
16	Write Multiple Registers	Write values into a block of contiguous registers (1 to 120)

2.3.3 Data Fields

The data field length varies, depending on whether the message is a request or a response to a packet. This field typically contains information required by the Secondary device to perform the command specified or to the response to a data request from the Primary device.

Because Modbus can return only positive numbers, in registers that contain signed numbers the negative numbers are encoded in two's-complement form. For example, in a 16-bit register a -7 becomes FFF9 in hexadecimal or 65529 in decimal.

2.3.4 Error Check Field

The Error Check Field consists of a 16-bit (2 byte) Cyclical Redundancy Check (CRC16). It allows the receiving device to detect a packet that has been corrupted by transmission errors.

2.3.5 RTU Framing

The example below shows a typical query and response from a Liebert® IntelliSlot™ interface card. The Primary device initiates a query asking Secondary Device, with address 2, for holding registers starting at holding register 40051 (offset 50) and including the next two registers (three total).

Table 2.3 Query sample

Secondary Address	Function Code	Starting Register		Number of Registers		CRC16	
		HI Byte	Lo Byte	HI Byte	Lo Byte	HI Byte	Lo Byte
02	03	00	32	00	03	E5	FA

Table 2.4 Response sample

Secondary Address	Function Code	Count: Bytes of Data	Register						CRC16	
			40051 Data		40052 Data		40053 Data		HI Byte	Lo Byte
			HI	Lo	HI	Lo	HI	Lo		
02	03	6	1	58	00	FA	00	54	1B	0D

The Secondary Device with address 2 responds to Function Code 3 with 6 bytes of hexadecimal data and ends with CRC16 checksum.

Register values: 40051 = 158 (hex) = 344 (decimal)

40052 = FA (hex) = 250 (decimal)

40053 = 54 (hex) = 84 (decimal)

2.3.6 Coil and Register Numbering

Coil/Register Numbers can be thought of as location names since they do not appear in the actual messages. The Data Addresses are used in the messages.

For example, the first Holding Register, number 40001, has the Data Address 0000.

The difference between these two values is the **offset**.

Each table has a different offset. 1, 10001, 30001 and 40001.

Coil/Register Numbers	Data Addresses	Type	Table Name
1-9999	0000 to 270E	Read-Write	Discrete Output Coils
10001-19999	0000 to 270E	Read-Only	Discrete Input Contacts
30001-39999	0000 to 270E	Read-Only	Analog Input Registers
40001-49999	0000 to 270E	Read-Write	Analog Output Holding Registers

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary

Data Label	Data Description
(Deprecated) Free Cooling Status	(Deprecated) Free cooling status.
Actual Air Temperature Set Point	The actual set point being used for air temperature control. This value may differ from [Air Temperature Set Point] if compensation is applied by the control.
Actual Auxiliary Air Temperature	Actual auxiliary air temperature value being used for control. This value may differ from the raw value received from the auxiliary device if filtering is applied.
Actual Cold Aisle Humidity	Actual humidity value being used for cold aisle humidity control. The value is calculated from multiple humidity measurements using [Cold Aisle Humidity Calculation Method].
Actual Cold Aisle Temperature	Actual temperature value being used for cold aisle temperature control. The value is calculated from multiple temperature measurements using [Cold Aisle Temperature Calculation Method].
Actual Humidity Set Point	The actual set point being used for humidity control. This value may differ from [Humidity Set Point] if compensation is applied by the control.
Adjusted Humidity	Humidity value being used for control. This value may differ from the actual measured [Return Humidity] based on several factors which may include, but are not limited to, selection of humidity control sensor and humidity control type.
Air Economizer Availability	Indicates if the outside air conditions are appropriate for cooling with the air economizer or glycol freecooling.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Air Economizer Control Source	Source of control of the air economizer.
Air Economizer Emergency Override	Indoor room temperature has exceeded its upper threshold and the outdoor air damper has been opened for emergency cooling.
Air Economizer Reduced Airflow	Air economizer filter is dirty and needs to be cleaned or replaced.
Air Filter Differential Pressure	Differential pressure across the air filter.
Air Temperature Control Integration Time	Time value used when system is under integral air temperature control.
Air Temperature Control Sensor	Sensor from which air temperature measurements will be used for cooling and heating control.
Air Temperature Control Type	Type of algorithm used to control the system's output air temperature.
Air Temperature Dead Band	Value that is divided evenly to form a temperature range above and below [Air Temperature Set Point]. If measured air temperature is within this range, no heating or cooling will occur.
Air Temperature Proportional Band	Value that is divided evenly to form proportional temperature control bands above and below [Air Temperature Set Point].
Air Temperature Set Point	Desired air temperature. This set point is dependent upon which sensor is selected for control.
Airflow Sensor Issue	Airflow sensor is disconnected or the signal is out of range.
Ambient Air Sensor Issue	Ambient air sensor is disconnected or the signal is out of range.
Analog Input Reading	Generic analog input reading (unitless).
Analog Output	Analog output
ATS Load Not Powered Timeout	Automatic Transfer Switch Load not powered timeout
ATS Non Priority Load Breaker Timeout	Automatic Transfer Switch Non-priority load breaker timeout
ATS Switch Mode	ATS Switch Mode
Audit Log Record Counter	Number of audit log records that have been sent to the client.
Audit Log Update	Audit log has been updated.
Auto Restart Delay	If power is lost, the control will delay this amount of time after power is restored before restarting the unit.
Auto Restart Enable	Enable/disable automatic restart of unit after a power cycle.
Auto Tune License Expired	License for the AutoTune feature has expired.
Auto Tune License Expiring	License for the AutoTune feature has not been refreshed in 30 days and will be expiring soon.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Automatic Transfer Switch - Active Power Supply	Indicates which power supply is in use by the Automatic Transfer Switch.
Automatic Transfer Switch - Power Supply 1 Status	Status of power supply 1 in Automatic Transfer Switch.
Automatic Transfer Switch - Power Supply 2 Status	Status of power supply 2 in Automatic Transfer Switch.
Aux Air Temp Device Communication Lost	Communication with external auxiliary device providing an air temperature value has been lost.
Back Draft Control Fan Speed	Fan speed when in back draft control mode.
BMS Communications Timeout	Building Management System (or external monitoring system) has not communicated with the system within the expected timeframe.
BMS Timeout Period	Timeframe within which the Building Management System (or external monitoring system) must communicate with the system to avoid a timeout.
Calculated Next Maintenance Month	Calculated month of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Year].
Calculated Next Maintenance Year	Calculated year of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Month].
Check Water System	Fluid check water system
Chilled Water Control Valve Failure	Chilled water valve out of position. Chilled water control valve position does not match expected value.
Chilled Water Flow Meter Sensor Failure	Chilled water flow meter sensor is disconnected or the signal is out of range.
Chilled Water Inlet Temperature Control Active	Chilled water inlet temperature control is active.
Chilled Water Inlet Temperature Sensor Failure	Chilled water inlet temperature sensor is disconnected or the signal is out of range.
Chilled Water Inlet Temperature	Temperature of the water entering the hydraulic circuit of the chilled water unit.
Chilled Water Outlet Temperature Sensor Failure	Chilled water outlet temperature sensor is disconnected or the signal is out of range.
Chilled Water Outlet Temperature	Temperature of the water exiting the hydraulic circuit of the chilled water unit.
Chilled Water Valve Hours Exceeded	[Chilled Water Valve Hours] has exceeded [Chilled Water Valve Operating Hours Threshold].

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Chilled Water Valve Hours	Operating hours for chilled water valve since last reset of this value.
Chilled Water Valve Operating Hours Threshold	Operating hours threshold for the chilled water valve. When the number of operating hours reaches this threshold, an event is generated.
Chilled Water Valve Reset Enable	Enable/disable the ability to reset the chilled water valve.
Circuit Cooling Load	The amount of heat energy currently being removed by a single refrigeration circuit.
Clogged Air Filter - Event Control	Enable/disable the activation of the [Clogged Air Filter] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Clogged Air Filter - Event Type	The event type for the [Clogged Air Filter] event.
Clogged Air Filter	Air filter is dirty and needs to be (cleaned or) replaced.
Cold Aisle Air Sensor Failure	Cold aisle sensor measuring air temperature and humidity is disconnected or the signal is out of range.
Cold Aisle Cascade Fan Speed Max Set Point	Cold aisle maximum fan speed when system is in cascade mode and one or more units in the system are in standby.
Cold Aisle Control Enable	Enable/disable cold aisle control.
Cold Aisle Fan Speed Max Set Point	Cold aisle maximum fan speed when system is not in cascade mode OR when system is in cascade mode and no units in the system are in standby.
Cold Aisle Fan Speed Min Set Point	Cold aisle minimum fan speed.
Cold Aisle Force Max Fan/Cooling - Ext Control	The cold aisle fan speed and system cooling can be forced to 100% via an external input signal. Use this value to enable/disable that feature.
Cold Aisle Humidity Calculation Method	Algorithm used to calculate a single cold aisle humidity value from multiple humidity measurements.
Cold Aisle Sensor Air Temperature	Air temperature measured by cold aisle sensor.
Cold Aisle Sensor Humidity	Humidity measured by cold aisle sensor.
Cold Aisle Temperature Calculation Method	Algorithm used to calculate a single cold aisle temperature value from multiple temperature measurements.
Cold Aisle Temperature/Humidity Team Sensor Failure	Cold aisle team sensor measuring air temperature and humidity is disconnected or the signal is out of range.
Communicate At Fan Power Off	Communicate with fans at power off
Compressor 1B Hours Exceeded	Fixed compressor 1B run hours have exceeded the threshold.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Compressor 1B Thermal Overload	Fixed compressor 1B is shut down due to thermal overload.
Compressor 2B Hours Exceeded	Fixed compressor 2B run hours have exceeded the threshold.
Compressor 2B Thermal Overload	Fixed compressor 2B is shut down due to thermal overload.
Compressor Capacity Control State	Compressor capacity control state. When 'ON', the cooling capacity of the compressor has been reduced.
Compressor Capacity Reduced	Compressor capacity has been reduced.
Compressor Freeze Protection	Compressor has entered the freeze protection phase.
Compressor High Head Pressure - Event Control	Enable/disable the activation of the [Compressor High Head Pressure] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Compressor High Head Pressure - Event Type	The event type for the [Compressor High Head Pressure] event.
Compressor High Head Pressure	Compressor is shut down due to high head pressure.
Compressor High Pressure Transducer Issue	Compressor high pressure transducer is disconnected or the signal is out of range.
Compressor Hours Exceeded	[Compressor Hours] has exceeded [Compressor Hours Threshold].
Compressor Hours Threshold	Threshold value used in the [Compressor Hours Exceeded] event.
Compressor Hours	Operating hours for compressor since last reset of this value.
Compressor Lockout	Enable/disable the use of the compressor.
Compressor Low Differential Pressure Lockout	Compressor exceeded maximum startup attempts due to low differential pressure. Compressor is shutdown and has been disabled.
Compressor Low Pressure Transducer Issue	Compressor low pressure transducer is disconnected or the signal is out of range.
Compressor Low Suction Pressure - Event Control	Enable/disable the activation of the [Compressor Low Suction Pressure] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Compressor Low Suction Pressure - Event Type	The event type for the [Compressor Low Suction Pressure] event.
Compressor Low Suction Pressure	Compressor is shut down due to low suction pressure.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Compressor Pump Down Issue - Event Control	Enable/disable the activation of the [Compressor Pump Down Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Compressor Pump Down Issue - Event Type	The event type for the [Compressor Pump Down Issue] event.
Compressor Pump Down Issue	Unable to pump down suction-side pressure during compressor shutdown.
Compressor Short Cycle - Event Control	Enable/disable the activation of the [Compressor Short Cycle] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Compressor Short Cycle - Event Type	The event type for the [Compressor Short Cycle] event.
Compressor Short Cycle	Compressor short cycle. A short cycle is defined as turning on and off a number of times over a set time period.
Compressor State	Compressor operational state.
Compressor Suction Pressure	Refrigerant pressure at the input of the compressor.
Compressor Superheat Over Threshold	Compressor discharge refrigerant superheat temperature has exceeded an upper threshold.
Compressor Thermal Overload - Event Control	Enable/disable the activation of the [Compressor Thermal Overload] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Compressor Thermal Overload - Event Type	The event type for the [Compressor Thermal Overload] event.
Compressor Thermal Overload	Compressor is shut down due to thermal overload.
Compressor Utilization	Present compressor utilization expressed as a percentage of the maximum rated capacity.
Condenser Circuit Unspecified General Event	One or more unspecified condenser circuit events active. See local unit display for further details.
Condenser Communication Lost	Communication with condenser unit has been lost.
Condenser Control Board Issue	The condenser control board is reporting an issue.
Condenser Fan Current	Condenser fan's measured input current.
Condenser Fan Issue	Condenser fan is not operating within its operational parameters.
Condenser Fan Power	Condenser fan's measured input power.
Condenser Fan Reversal Requested	Request the condenser fans to rotate in the reverse direction.
Condenser Fan Speed	Condenser fan speed expressed as a percentage of the maximum rated speed.
Condenser Issue - Event Control	Enable/disable the activation of the [Condenser Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Condenser Issue - Event Type	The event type for the [Condenser Issue] event.
Condenser Issue	Condenser is not operating within its operational parameters.
Condenser Low Noise Mode - Full Days	Days of the week selected for low noise mode full day scheduling.
Condenser Low Noise Mode - Interval Days	Days of the week selected for low noise mode interval scheduling.
Condenser Low Noise Mode Max Fan Speed	Maximum fan speed when condenser is placed in low noise mode.
Condenser Low Noise Mode Schedule Control	Enable/disable scheduled control of condenser low noise mode.
Condenser Low Noise Mode Start Time	The time of day at which the condenser will transition into low noise mode.
Condenser Low Noise Mode State	State of condenser low noise mode scheduler control.
Condenser Low Noise Mode Stop Time	The time of day at which the condenser will transition out of low noise mode.
Condenser Max Fan Speed Override	Fan speed exceeding the maximum set point in order to alleviate a high temperature or pressure condition.
Condenser Normal Mode Max Fan Speed	Maximum fan speed when condenser is not in low noise mode.
Condenser Outside Air Temp Out of Operating Range	[Condenser Outside Air Temperature] is either above an upper threshold or below a lower threshold.
Condenser Outside Air Temp Sensor Issue	Condenser outside air temperature sensor is disconnected or the signal is out of range.
Condenser Outside Air Temperature	Condenser ambient outside air temperature.
Condenser Refrigerant Pressure Over Threshold	Condenser refrigerant pressure has exceeded a threshold.
Condenser Refrigerant Pressure Sensor Issue	Condenser refrigerant pressure sensor is disconnected or the signal is out of range.
Condenser Refrigerant Pressure Under Threshold	Condenser refrigerant pressure has dropped below a threshold.
Condenser Refrigerant Pressure	Pressure of the refrigerant in a condenser circuit.
Condenser Refrigerant Type	Condenser refrigerant type.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Condenser Remote Shutdown	Condenser is shut down by a remote signal.
Condenser Supply Refrigerant Over Temp	Condenser supply refrigerant temperature has exceeded a threshold.
Condenser Supply Refrigerant Temp Sensor Issue	Condenser supply refrigerant temperature sensor is disconnected or the signal is out of range.
Condenser Supply Refrigerant Temperature	Temperature of the supply refrigerant in a condenser circuit.
Condenser Supply Refrigerant Under Temp	Condenser supply refrigerant temperature has dropped below a specified threshold.
Condenser TVSS Issue	The condenser Transient Voltage Surge Suppressor or Surge Protection Device has failed.
Condenser Unit Unspecified General Event	One or more unspecified condenser unit events active. See local unit display for further details.
Condenser VFD Issue	The condenser fan Variable Frequency Drive is offline.
Control Units Remote Shutdown Mismatch	The remote shutdown status of the master control unit does not match the remote shutdown status of the slave control unit.
Control Units Unit Code Mismatch	Unit codes for the master and slave control units do not match.
Cooling Capacity	Cooling capacity in use, expressed as a percentage of the maximum rated capacity.
Cooling Capacity	Cooling capacity in use, expressed in kilowatts.
Cooling Control Temperature	Temperature value being used for cooling capacity control. This value is compared against the temperature set point to determine the amount of cooling to be applied.
Cooling Fluid Source Temperature	Temperature of the cooling fluid being provided by the source.
Cooling State	Cooling operational state.
Customer Input 1 - Event Control	Enable/disable the activation of the [Customer Input 1] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 1 - Event Type	The event type for the [Customer Input 1] event.
Customer Input 1	Customer Input 1
Customer Input 2 - Event Control	Enable/disable the activation of the [Customer Input 2] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 2 - Event Type	The event type for the [Customer Input 2] event.
Customer Input 2	Customer Input 2
Customer Input 3 - Event Control	Enable/disable the activation of the [Customer Input 3] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Customer Input 3 - Event Type	The event type for the [Customer Input 3] event.
Customer Input 3	Customer Input 3
Customer Input 4 - Event Control	Enable/disable the activation of the [Customer Input 4] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 4 - Event Type	The event type for the [Customer Input 4] event.
Customer Input 4	Customer Input 4
Dehum Reheat Low Limit 1	Value added to [Dehum Reheat Low Limit Set Point]. If the air temperature measured by [Dehum Reheat Low Limit Sensor] falls below the sum of those values, compressor operation will be limited.
Dehum Reheat Low Limit 2	Value added to [Dehum Reheat Low Limit Set Point]. If the air temperature measured by [Dehum Reheat Low Limit Sensor] falls below the sum of those values, all compressors will be turned off for dehumidification.
Dehum Reheat Low Limit Sensor	Air temperature sensor whose measurements will be compared against [Dehum Reheat Low Limit Set Point] to determine when a compressor and reheat are used to support dehumidification.
Dehum Reheat Low Limit Set Point	Air temperature set point used to determine when a compressor and reheat are used to support dehumidification.
Dehum Reheat Proportional Band	Size of temperature band below [Dehum Reheat Low Limit Set Point] used to determine the temperatures at which each reheater is activated. As the temperature falls further below the set point, more reheaters are activated.
Dehumidification Fan Speed Min Set Point	Minimum fan speed when system dehumidification is active.
Dehumidifier Hours Exceeded	Operating hours for the dehumidifier have exceeded the threshold.
Dehumidifier Hours Threshold	Threshold value used in the [Dehumidifier Hours Exceeded] event.
Dehumidifier Hours	Operating hours for dehumidifier since last reset of this value.
Dehumidifier State	Dehumidifier operational state.
Dehumidifier Utilization	Present dehumidifier utilization expressed as a percentage of the maximum rated capacity.
Dew Point Dead Band	Value that is divided evenly to form a range above and below [Dew Point Set Point]. If measured humidity is within this range, no humidification or dehumidification will occur. This parameter is used when [Humidity Control Type] is set to Dew Point.
Dew Point Max Adjust	Dew Point Margin Maximum Set Point Adjust
Dew Point Over Temp Threshold	Threshold value used in the [Dew Point Over Temperature] event.
Dew Point Over Temperature	Dew point temperature reading has exceeded the upper threshold.
Dew Point Proportional Band	Value that is divided evenly to form proportional humidity control bands above and below [Dew Point Set Point]. This parameter is used when [Humidity Control Type] is set to Dew Point.
Dew Point Set Point	Desired dew point temperature.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Dew Point Under Temp Threshold	Threshold value used in the [Dew Point Under Temperature] event.
Dew Point Under Temperature	Dew point temperature reading has dropped below the lower threshold.
Dig Scroll Comp Discharge Over Temp - Event Ctrl	Enable/disable the activation of the [Dig Scroll Comp Discharge Over Temp] event.
Dig Scroll Comp Discharge Over Temp - Event Type	The event type for the [Dig Scroll Comp Discharge Over Temp] event.
Dig Scroll Comp Discharge Temp Sensor Issue	Digital scroll compressor discharge temperature sensor is disconnected or the signal is out of range.
Dig Scroll Comp Discharge Temp	Digital scroll compressor discharge temperature.
Dig Scroll Comp Over Temp	Digital scroll compressor is shut down due to head temperature exceeding an upper threshold.
Digital Output Board Not Detected	Digital output board is required to be connected, but no signal is detected.
Digital Scroll Compressor Loading	Present digital scroll compressor utilization expressed as a percentage of the maximum rated capacity.
Door Open	An open door was detected
EconoPhase Proportional Band Switchover	After entering EconoPhase mode, the threshold for continuing EconoPhase operation is gradually reduced to this percentage of [Air Temperature Proportional Band]. If the air temperature cannot be maintained within this reduced proportional band, the system will switch over to compressor control.
EEV Unspecified General Event	One or more unspecified electronic expansion valve events active. See local unit display for further details.
Electric Reheat State	Electric reheat operational state.
Electric Reheater Hours Exceeded	[Electric Reheater Hours] has exceeded [Electric Reheaters Hours Threshold].
Electric Reheater Hours Threshold	Threshold value used in the [Electric Reheater Hours Exceeded] event.
Electric Reheater Hours	Operating hours for electric reheat since last reset of this value.
Energy Consumption	Energy consumption since the last reset of this value.
Event Log Record Counter	Number of event log records that have been sent to the client.
Expected Condenser Unit Count	Number of physical condenser units that are expected to be connected to the system.
Ext Air Damper Position Issue	Air damper position does not match expected value, as indicated by an external input signal.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Ext Air Sensor A Dew Point Temp	Dew point temperature as measured by external air sensor A.
Ext Air Sensor A Event Control	Enable/disable the activation of events related to measurements by the external air sensor A.
Ext Air Sensor A High Humidity - Event Control	Enable/disable the activation of the [Ext Air Sensor A High Humidity] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Air Sensor A High Humidity - Event Type	The event type for the [Ext Air Sensor A High Humidity] event.
Ext Air Sensor A High Humidity Threshold	Threshold value used in the [External Air Sensor A High Humidity] event.
Ext Air Sensor A High Humidity	[Ext Air Sensor A Humidity] has exceeded [Ext Air Sensor A High Humidity Threshold].
Ext Air Sensor A Humidity	Relative humidity as measured by external air sensor A.
Ext Air Sensor A Issue	The external air sensor A is disconnected or the signal is out of range.
Ext Air Sensor A Low Humidity - Event Control	Enable/disable the activation of the [Ext Air Sensor A Low Humidity] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Air Sensor A Low Humidity - Event Type	The event type for the [Ext Air Sensor A Low Humidity] event.
Ext Air Sensor A Low Humidity Threshold	Threshold value used in the [External Air Sensor A Low Humidity] event.
Ext Air Sensor A Low Humidity	[Ext Air Sensor A Humidity] has dropped below [Ext Air Sensor A Low Humidity Threshold].
Ext Air Sensor A Over Temp - Event Control	Enable/disable the activation of the [External Air Sensor A Over Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Air Sensor A Over Temp - Event Type	The event type for the [External Air Sensor A Over Temperature] event.
Ext Air Sensor A Over Temp Threshold	Threshold value used in the [External Air Sensor A Over Temperature] event.
Ext Air Sensor A Over Temperature	[Ext Air Sensor A Temperature] has exceeded [External Air Sensor A Over Temp Threshold].
Ext Air Sensor A Temperature	Air temperature as measured by external air sensor A.
Ext Air Sensor A Under Temp - Event Control	Enable/disable the activation of the [Ext Air Sensor A Under Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Air Sensor A Under Temp - Event Type	The event type for the [Ext Air Sensor A Under Temperature] event.
Ext Air Sensor A Under Temp Threshold	Threshold value used in the [External Air Sensor A Under Temperature] event.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Ext Air Sensor A Under Temperature	[Ext Air Sensor A Temperature] has dropped below [Ext Air Sensor A Under Temp Threshold].
Ext Air Sensor B Humidity	Relative humidity as measured by external air sensor B.
Ext Air Sensor B Temperature	Air temperature as measured by external air sensor B.
Ext Air Sensor C Humidity	Relative humidity as measured by external air sensor C.
Ext Air Sensor C Temperature	Air temperature as measured by external air sensor C.
Ext Compressor Lockout - Event Control	Enable/disable the activation of the [Ext Compressor Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Compressor Lockout - Event Type	The event type for the [Ext Compressor Lockout] event.
Ext Compressor Lockout	The compressor is shut down and disabled by an external input signal.
Ext Condenser Pump High Water - Event Control	Enable/disable the activation of the [Ext Condenser Pump High Water] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Condenser Pump High Water - Event Type	The event type for the [Ext Condenser Pump High Water] event.
Ext Condenser Pump High Water	High water is detected in the condensate pump by the auxiliary float, as indicated by an external input signal.
Ext Dew Point Over Temp Threshold	Threshold value used in the [Ext Dew Point Over Temperature] event.
Ext Dew Point Over Temperature	At least one dew point temperature reading ([Ext Air Sensor A Dew Point Temp], [Ext Air Sensor B Dew Point Temp]..) has exceeded [Ext Dew Point Over Temp Threshold].
Ext Dew Point Under Temp Threshold	Threshold value used in the [Ext Dew Point Under Temperature] event.
Ext Dew Point Under Temperature	At least one dew point temperature reading ([Ext Air Sensor A Dew Point Temp], [Ext Air Sensor B Dew Point Temp]..) has dropped below [Ext Dew Point Under Temp Threshold].
Ext Free Cooling Lockout - Event Control	Enable/disable the activation of the [Ext Free Cooling Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Free Cooling Lockout - Event Type	The event type for the [Ext Free Cooling Lockout] event.
Ext Free Cooling Lockout	Free cooling is disabled by an external input signal.
Ext Humidifier Lockout - Event Control	Enable/disable the activation of the [Ext Humidifier Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Humidifier Lockout - Event Type	The event type for the [Ext Humidifier Lockout] event.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Ext Humidifier Lockout	The humidifier is shut down and disabled by an external input signal.
Ext Loss of Air Blower - Event Control	Enable/disable the activation of the [Ext Loss of Air Blower] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Loss of Air Blower - Event Type	The event type for the [Ext Loss of Air Blower] event.
Ext Loss of Air Blower	Loss of air blower is detected, as indicated by an external input signal.
Ext Loss of Flow - Event Control	Enable/disable the activation of the [Ext Loss of Flow] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Loss of Flow - Event Type	The event type for the [Ext Loss of Flow] event.
Ext Loss of Flow	Loss of flow is detected, as indicated by an external input signal.
Ext Over Temperature - Event Control	Enable/disable the activation of the [Ext Over Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Over Temperature - Event Type	The event type for the [Ext Over Temperature] event.
Ext Over Temperature	A temperature has exceeded its threshold, as indicated by an external input signal.
Ext Power Source A Failure	Unit main power source A failure, as indicated by an external input signal.
Ext Power Source B Failure	Unit main power source B failure, as indicated by an external input signal.
Ext Reheat Lockout - Event Control	Enable/disable the activation of the [Ext Reheat Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Reheat Lockout - Event Type	The event type for the [Ext Reheat Lockout] event.
Ext Reheat Lockout	The reheater is shut down and disabled by an external input signal.
Ext Standby Glycol Pump On - Event Control	Enable/disable the activation of the [Ext Standby Glycol Pump On] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Standby Glycol Pump On - Event Type	The event type for the [Ext Standby Glycol Pump On] event.
Ext Standby Glycol Pump On	The standby glycol pump is on, as indicated by an external input signal.
Ext Standby Unit On - Event Control	Enable/disable the activation of the [Ext Standby Unit On] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Standby Unit On - Event Type	The event type for the [Ext Standby Unit On] event.
Ext Standby Unit On	Standby unit is on, as indicated by an external input signal.
External Air Sensor B Issue	The external air sensor B is disconnected or the signal is out of range.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
External Air Sensor C Issue	The external air sensor C is disconnected or the signal is out of range.
External Air Sensor D Issue	The external air sensor D is disconnected or the signal is out of range.
External Air Sensor E Issue	The external air sensor E is disconnected or the signal is out of range.
External Condenser TVSS Issue	The condenser Transient Voltage Surge Suppressor or Surge Protection Device has failed, as indicated by an external input signal.
External Condenser VFD Issue	The condenser fan Variable Frequency Drive is offline, as indicated by an external input signal.
External Fire Detected	Fire detected, as indicated by an external input signal.
External Supply Fluid Flow Issue	Supply fluid flow issue, as indicated by an external input signal.
External Supply Fluid High Temperature	Supply fluid temperature has exceeded a threshold, as indicated by an external input signal.
External Supply Fluid Temp Sensor Issue	Supply fluid temperature sensor is disconnected or the signal is out of range, as indicated by an external input signal.
Fan Back Draft Control Enable	Enable/disable fan back draft control.
Fan Back Draft Operation	Operational mode of the fan back draft control.
Fan Back Draft Speed Set Point	If [Fan Back Draft Control Enable] is enabled and unit is in standby, its evaporator fan will run at a fixed speed corresponding to this value.
Fan Control Mode	Fan control mode.
Fan Control Sensor	Sensor to be used for fan speed control.
Fan Current	Supply Fan Measured Current
Fan Error: DC-link undervoltage	Fan Error: DC-link undervoltage
Fan Error: General Failure	Supply Fan Error: General Failure
Fan Error: Hall Sensor Error	Supply Fan Error: Hall Sensor Error
Fan Error: Internal Comms Error	Supply Fan Error: Internal Communications Error
Fan Error: Locked Motor	Supply Fan Error: Locked Motor
Fan Error: Motor Overheated	Supply Fan Error: Motor Overheated
Fan Error: Phase Failure	Supply Fan Error: Phase Failure
Fan Error: Pwr Mod Overheated	Supply Fan Error: Power Module Overheated

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Fan Error: Speed Limit or Rotor Sens Calib	Supply Fan Error: Speed Limit or Rotor Sens Calib
Fan Hours Exceeded - Event Control	Enable/disable the activation of the [Fan Hours Exceeded] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Fan Hours Exceeded - Event Type	The event type for the [Fan Hours Exceeded] event.
Fan Hours Exceeded	Operating hours for the unit blower fan have exceeded the threshold.
Fan Hours Threshold	Threshold value used in the [Fan Hours Exceeded] event.
Fan Hours	Operating hours for fan since last reset of this value.
Fan Issue - Event Control	Enable/disable the activation of the [Fan Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Fan Issue - Event Type	The event type for the [Fan Issue] event.
Fan Issue	One or more fans are not operating within their operational parameters.
Fan Power	Supply Fan Measured Power
Fan Speed Control Temperature	Temperature value being used for fan speed control. This value is compared against the fan speed temperature set point to determine the fan speed.
Fan Speed Maximum Set Point	Maximum fan speed. This value may only be modified if iCOM is enabled to allow fan speed changes by the BMS.
Fan Speed Min Dehum	Minimum fan speed for dehumidification operation
Fan Speed Minimum Set Point	Minimum fan speed.
Fan Speed Temp Control Integration Time	Integration time value used when [Fan Speed Temperature Control Type] contains an integral term.
Fan Speed Temp Control Proportional Band	Value that is divided evenly to form proportional temperature control bands above and below [Fan Speed Temperature Set Point].
Fan Speed Temp Control Type	Type of algorithm used to control the fan speed when in decoupled mode. The algorithm is applied to the difference between the selected fan control sensor temperature and [Fan Speed Temperature Set Point].
Fan Speed Temperature Dead Band	Value that is divided evenly to form a temperature range above and below [Fan Speed Temperature Set Point]. If the fan control air temperature sensor is within this range, no changes to the fan speed will occur (unless overridden for internal safeguards).
Fan Speed Temperature Set Point	If fan is in decoupled mode and not under manual control, the fan speed will vary depending on the delta between the selected fan control sensor temperature and this set point.
Fan Speed	Fan speed expressed as a percentage of the maximum rated speed.
Fan State	Fan operational state.
Fan Warning: DC-link voltage high	Supply Fan Warning: DC-link voltage high
Fan Warning: High Interior Temperature	Supply Fan Warning: High Interior Electronic Temperature

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Fan Warning: High Motor Temperature	Supply Fan Warning: High Motor Temperature
Fan Warning: High Supply Voltage	Supply Fan Warning: High Supply Voltage
Fan Warning: Identification	Supply Fan Warning: Unexpected Fan Identification - Check Fan Firmware Version
Flow Dead Band	Fluid flow dead band
Flow Diff Prs Dead Band	Flow Diff Pressure Dead Band
Flow Integration Time	Fluid flow integration time
Flow Manual Pump Speed	Flow Manual Pump Speed
Flow Proportional Band	Fluid flow proportional band
Flow Rate	Fluid measured flow volume rate
Flow Sensor Failure	Fluid flow sensor failure
Flow Set Point	Fluid flow rate set point
Fluid Control Type	Fluid flow algorithm control type
Fluid Control Valve Position	Fluid Control Valve Position
Fluid Dew Pnt Margin	Fluid Dew Point Margin Control Operation
Fluid Dewpoint Margin Control	Fluid Loop Dewpoint Margin Control is active
Fluid Diff Prs Control Integration Time	Fluid Diff Pressure Control Integration Time
Fluid Diff Prs Prop Band	Flow Diff Pressure Proportional Band
Fluid Diff Prs Set Point	Fluid Diff Pressure Set Point
Fluid Flow Blocked	Fluid Loop Flow Blocked (Loss of Flow with High Supply Pressure)
Fluid Flow Control Integration Time	Fluid Flow Control Integration Time
Fluid Flow Dead Band	Fluid Flow Dead Band; evenly split above/below set point
Fluid Flow High Supply Pressure	Fluid Loop Flow High Supply Pressure
Fluid Flow Low Inlet Pressure	Fluid Loop Flow Low Inlet Pressure
Fluid Flow Proportional Band	Fluid Flow Proportional Band; evenly split above/below set point
Fluid Flow Rate	Flow rate of fluid used for cooling.
Fluid Flow Sensor Issue	The fluid flow sensor is disconnected or the signal is out of range.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Fluid Flow Set Point	Fluid Flow Set Point
Fluid Free Cooling Lockout Threshold	If the temperature of the cooling fluid drops below this value, fluid free cooling will be disabled.
Fluid High Differential Pressure	Fluid Loop High Differential Pressure (Supply - Return)
Fluid Inlet Pressure Sensor Issue	Fluid Loop Inlet Pressure Sensor Issue
Fluid Input Temperature	Temperature of the fluid entering the cooling coil.
Fluid Low Differential Pressure	Fluid Loop Low Differential Pressure (Supply - Return)
Fluid Low System Flow	Fluid Loop Low System Flow (Low total flow for units in group)
Fluid Output Temperature	Temperature of the fluid exiting the cooling coil.
Fluid Return Pressure Sensor Issue	Fluid Loop Return Pressure Sensor Issue
Fluid Supply Pressure Sensor Issue	Fluid Loop Supply Pressure Sensor Issue
Fluid Temperature Control Integration Time	Time value used when system is under integral fluid temperature control.
Fluid Temperature Control Type	Type of algorithm used to control the system's output fluid temperature.
Fluid Temperature Dead Band	Value that is divided evenly to form a temperature range above and below [Fluid Temperature Set Point].
Fluid Temperature Proportional Band	Value that is divided evenly to form proportional temperature control.
Fluid Temperature Sensor Issue	The fluid temperature sensor is disconnected or the signal is out of range.
Fluid Temperature Set Point	Desired chiller fluid temperature.
Force Networked Unit Rotation	If networked units are configured to rotate between standby and running, force the rotation to occur immediately.
Force Pump Rotate	Fluid force pump rotation (swap pump lead/lag operation)
Free Cooling Fluid Temperature	Free cooling fluid temperature.
Free Cooling Internal Control Mode	Free cooling internal control mode
Free Cooling Internal Temperature Delta	Minimum temperature delta required between supply fluid and internal ambient air temperatures in order to enable free cooling.
Free Cooling State	Free cooling operational state.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Free Cooling Status	Free cooling status.
Free Cooling Stopped - High Room Temp	Free cooling is temporarily disabled due to room temperature exceeding a preset delta above the the set point.
Free Cooling Temp Sensor Issue	The free cooling fluid temperature sensor is disconnected or the signal is out of range.
Free Cooling Valve Hours Exceeded	[Free Cooling Valve Hours] has exceeded [Free Cooling Valve Hours Threshold].
Free Cooling Valve Hours Threshold	Threshold value used in the [Free Cooling Valve Hours Exceeded] event.
Free Cooling Valve Hours	Operating hours for free cooling valve since last reset of this value.
Free Cooling Valve Open Position	Free cooling valve open position.
FSA Control Input Issue	The analog input used to set the air temperature set point for fan speed control is disconnected or the signal is out of range.
Group Independent Off	The group standby/cascade state for this unit has been overridden. The unit has been forced off.
Group Independent On	The group standby/cascade state for this unit has been overridden. The unit has been forced on.
Group Independent Operation Enable	Enable/disable group independent operation. If enabled, the user can override the unit's on/off state being controlled by its standby/cascade group.
Group Independent Operation	If this unit is part of a standby/cascade group, this value can be used to override the group control of the unit's on/off state.
Heating Fan Speed Min Set Point	Minimum fan speed when system heating is active.
Heating Lockout	Heating is shut down and disabled.
High Power Shutdown - Event Control	Enable/disable the activation of the [High Power Shutdown] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
High Power Shutdown - Event Type	The event type for the [High Power Shutdown] event.
High Power Shutdown	Supply to high power components has been shutdown.
High Return Air Temperature Threshold	Threshold value used in the [Return Air Over Temperature] event.
High Return Humidity - Event Control	Enable/disable the activation of the [High Return Humidity] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
High Return Humidity - Event Type	The event type for the [High Return Humidity] event.
High Return Humidity Threshold	Threshold value used in the [High Return Humidity] event.
High Return Humidity	Return air high humidity event.
High Static Pressure	High static pressure event.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
High Supply Air Temperature Threshold	Threshold value used in the [Supply Air Over Temperature] event.
Hot Water / Hot Gas State	Hot water / hot gas operational state.
Hot Water / Hot Gas Valve Hours Exceeded	[Hot Water / Hot Gas Valve Hours] has exceeded [Hot Water / Hot Gas Valve Hours Threshold].
Hot Water / Hot Gas Valve Hours Threshold	Threshold value used in the [Hot Water / Hot Gas Valve Hours Exceeded] event.
Hot Water / Hot Gas Valve Hours	Operating hours for hot water / hot gas valve since last reset of this value.
Hot Water / Hot Gas Valve Open Position	Hot water / hot gas valve open position.
Humidification Fan Speed Min Set Point	Minimum fan speed when system humidification is active.
Humidifier Control Board Not Detected	Humidifier control board is required to be connected, but no signal is detected.
Humidifier Cylinder Worn	Humidifier cylinder is not operating properly and needs to be replaced.
Humidifier Hours Exceeded	Operating hours for the humidifier have exceeded the threshold.
Humidifier Hours Threshold	Threshold value used in the [Humidifier Hours Exceeded] event.
Humidifier Hours	Operating hours for humidifier since last reset of this value.
Humidifier Issue - Event Control	Enable/disable the activation of the [Humidifier Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Humidifier Issue - Event Type	The event type for the [Humidifier Issue] event.
Humidifier Issue	Humidifier issue detected, causing it to be locked out.
Humidifier Lockout	Enable/disable the use of the humidifier.
Humidifier Low Water	The water level in the humidifier has dropped below its threshold.
Humidifier Over Current	The electrical current to the humidifier has exceeded its upper threshold.
Humidifier State	Humidifier operational state.
Humidifier Under Current	The electrical current to the humidifier has dropped below its lower threshold.
Humidifier Utilization	Present humidifier utilization expressed as a percentage of the maximum rated capacity.
Humidity Control Integration Time	Time value used to add an integral term to humidity control. If set to 0, time will not be a factor in the control algorithm.
Humidity Control Sensor	Sensor from which humidity measurements will be used for humidification and dehumidification control.
Humidity Control Type	Type of algorithm to use for control of output humidity.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Humidity Control Type	Type of algorithm to use for control of output humidity.
Humidity Dead Band	Value that is divided evenly to form a range above and below [Humidity Set Point]. If measured humidity is within this range, no humidification or dehumidification will occur.
Humidity Proportional Band	Value that is divided evenly to form proportional humidity control bands above and below [Humidity Set Point]. This setting applies to Relative, Predictive and Compensated [Humidity Control Type] selections.
Humidity Set Point	Desired relative humidity.
Infrared Humidifier Flush Rate	A multiple of an internal time constant that determines the flush duration of the infrared humidifier water pan.
Input Undervoltage	One or more of the input phase voltages has dropped below the limit.
Instantaneous Power	Total electrical power currently being consumed.
Inverter Temperature	Inverter Temperature
Local Cooling Override	The local unit override status for cooling capacity.
Local Dehumidifier Override	The local unit override status for the dehumidifier.
Local Electric Heat Override	The local unit override status for electric heat.
Local Fan Override	The local unit override status for fan speed.
Local Humidifier Override	The local unit override status for the humidifier.
Loss of Air Flow	No air flow through the unit due to failure of all fans.
Low Return Air Temperature Threshold	Threshold value used in the [Return Air Under Temperature] event.
Low Return Humidity - Event Control	Enable/disable the activation of the [Low Return Humidity] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Low Return Humidity - Event Type	The event type for the [Low Return Humidity] event.
Low Return Humidity Threshold	Threshold value used in the [Low Return Humidity] event.
Low Return Humidity	Return air low humidity event.
Low Static Pressure	Low static pressure event.
Low Supply Air Temperature Threshold	Threshold value used in the [Supply Air Under Temperature] event.
Main Chilled Water Valve	The master valve in a dual valve chilled water system.
Main Fan Overload - Event Control	Enable/disable the activation of the [Main Fan Overload] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Main Fan Overload - Event Type	The event type for the [Main Fan Overload] event.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Main Fan Overload	Main fan is shut down due to thermal overload.
Maintenance Completed	Maintenance has been completed on the unit.
Maintenance Due	The calculated maintenance date has been reached.
Maintenance Ramp	The ratio of operations performed to the calculated operations available between maintenance intervals.
Maintenance Tracking State	Maintenance tracking operational state.
Master Unit Communication Lost - Event Control	Enable/disable the activation of the [Master Unit Communication Lost] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Master Unit Communication Lost - Event Type	The event type for the [Master Unit Communication Lost] event.
Master Unit Communication Lost	Communication with master unit has been lost.
Minimum Chilled Water Temp Set Point Enable	Enable/disable the activation of [Minimum Chilled Water Temp Set Point].
Minimum Chilled Water Temp Set Point	Minimum desired chilled water temperature.
Mixed Mode Lockout	Mixed mode has been entered too many times over a rolling time period and has been temporarily disabled. Mixed mode is defined as the use of a compressor on one refrigeration circuit and the use of a refrigerant pump on the other circuit.
Modbus Automatic Transfer Switch Communication Lost	Communications with Modbus Automatic Transfer Switch has been lost
Modbus Power Meter Communication Lost	Communication with Modbus power meter has been lost.
Networked Unit Daily Rotation Frequency	If [Networked Unit Rotation Frequency] is set to 'Daily', this sets the frequency of rotation within each day.
Networked Unit Rotation Count	If networked units are configured to rotate between standby and running, this is the number of units that will rotate at the selected rotation time.
Networked Unit Rotation Frequency	Configures the frequency with which networked units will rotate between a running state and a standby state.
Networked Unit Rotation Time	If networked units are configured to rotate between standby and running, this is the time the rotation will occur on the day specified by [Networked Unit Rotation Frequency].
Outside Air Temperature	Ambient outside air temperature.
PHE Fluid Supply Temperature	Plate Heat Exchanger Fluid Supply Temperature
PHE Sup Tem Snsr Fail	Plate Heat Exchanger Supply Temperature Sensor Fail
Power Source: All status are okay	Automatic Transfer Switch Power Source: All status are okay

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Power Source: Breaker command status closed	Automatic Transfer Switch Power Source: Breaker command status closed
Power Source: Breaker is closed	Automatic Transfer Switch Power Source: Breaker is closed
Power Source: Breaker Operating Hour Exceeded	Automatic Transfer Switch Power Source: Breaker operating hour exceeded
Power Source: Breaker Operation Count	Automatic Transfer Switch Power Source: Breaker Operation Count
Power Source: Breaker Timeout Issue	Automatic Transfer Switch Power Source: Breaker timeout issue
Power Source: Breaker withdrawn issue	Automatic Transfer Switch Power Source: Breaker withdrawn issue
Power Source: Frequency Is Too High	Automatic Transfer Switch Power Source: Frequency is too high
Power Source: Frequency Is Too Low	Automatic Transfer Switch Power Source: Frequency is too low
Power Source: L1-L2 voltage	Automatic Transfer Switch Power Source: L1-L2 voltage
Power Source: L2-L3 voltage	Automatic Transfer Switch Power Source: L2-L3 voltage
Power Source: L3-L1 voltage	Automatic Transfer Switch Power Source: L3-L1 voltage
Power Source: Line Frequency	Automatic Transfer Switch Power Source: Line Frequency
Power Source: Line Operating Hour Exceeded	Automatic Transfer Switch Power Source: Line operating hour exceeded
Power Source: Phase Sequence Issue	Automatic Transfer Switch Power Source: Phase sequence issue
Power Source: Voltage Is Too High	Automatic Transfer Switch Power Source: Voltage is too high
Power Source: Voltage Is Too Low	Automatic Transfer Switch Power Source: Voltage is too low
Power Source: Voltage Phase Loss	Automatic Transfer Switch Power Source: Voltage phase loss
Power Source: Voltages Are Asymmetric	Automatic Transfer Switch Power Source: Voltages are asymmetric
PRE Operational Mode	Pumped Refrigerant Economizer operational mode.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Master Cooling Fluid Source	Master source of fluid for cooling purposes.
Pump Drive Communications	Pump Drive Communications Status
Pump Drive Low AC Alarm	Pump Drive Low AC Alarm
Pump Drive Over Temperature	Pump Drive Over Temperature
Pump Drive Overload	Pump Drive Overload
Pump Drive Phase Loss Active	Pump Drive Phase Loss Active
Pump Drive Product Identification	Pump Drive Product Identification
Pump Drive Warning	Pump Drive Warning
Pump Expected Speed	Fluid pump expected speed for flow set point
Pump Flow Failure	Fluid pump flow failure
Pump Hours Threshold	Threshold value used in the [Pump Hours Exceeded] event.
Pump Hours	Operating hours for pump since last reset of this value.
Pump Inlet Refrigerant Temperature	Refrigerant temperature at the inlet of the pump.
Pump Inverter Failure	Fluid pump inverter failure
Pump Motor Amps	Pump Motor Amps
Pump Motor Power	Pump Motor Power
Pump Operating State	Fluid pump operating state
Pump Operating Without Flow	Fluid pump operation with no flow
Pump Operation Duration	Pump periodic operation duration
Pump Operation Period	Pump shall periodically operate if off for too long
Pump Operation Speed	Pump periodic operation speed
Pump Operation Type	Pump periodic operation type
Pump Outlet Refrigerant Temperature	Refrigerant temperature at the outlet of the pump.
Pump Run Time	Fluid pump run time
Pump Speed	Fluid pump speed
Pump Speed	Pump speed expressed as a percentage of the maximum rated speed.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Pump Speed	Pump speed expressed as a percentage of the maximum rated speed.
Pump State	Pump operational state.
Pump Unspecified General Event	One or more unspecified pump events active. See local unit display for further details.
Quick Start Unit Cascade On Delay	When a Teamwork unit restarts after a power cycle, this value is used instead of [Unit Cascade On Delay]. The system will return to the use of [Unit Cascade On Delay] after a period of time determined by a predefined algorithm.
RAM Battery Issue	RAM or RAM backup battery is not operating correctly.
Raw Auxiliary Air Temperature	Air temperature value sent by an external auxiliary device, with no additional filtering by the receiving system. This may be an aggregated value from multiple sensors.
Reheat Utilization	Present reheating utilization expressed as a percentage of the maximum rated capacity.
Reheater Lockout	Enable/disable the use of the reheater.
Reheater Over Temperature	The temperature of the reheater has exceeded its threshold.
Remote Sensor Average Over Temperature	[Remote Sensor Average Temperature] has exceeded [Remote Sensor Over Temp Threshold].
Remote Sensor Average Temperature	Average value of remote sensor temperature measurements.
Remote Sensor Average Under Temperature	[Remote Sensor Average Temperature] has dropped below [Remote Sensor Under Temp Threshold].
Remote Sensor Issue	Remote sensor is disconnected or the signal is out of range.
Remote Sensor Maximum Temperature	Maximum value of remote sensor temperature measurements.
Remote Sensor Over Temp Threshold	Threshold value used in the remote air sensor over temperature events.
Remote Sensor Over Temperature	[Remote Sensor Temperature] has exceeded [Remote Sensor Over Temp Threshold].
Remote Sensor System Average Over Temperature	[Remote Sensor System Average Temperature] has exceeded [Remote Sensor Over Temp Threshold].
Remote Sensor System Average Temperature	Average value of remote sensor temperature measurements among a group of interconnected units in a single system.
Remote Sensor System Average Under Temperature	[Remote Sensor System Average Temperature] has dropped below [Remote Sensor Under Temp Threshold].
Remote Sensor System Maximum Temperature	Maximum value of remote sensor temperature measurements among a group of interconnected units in a single system.
Remote Sensor Temperature	Air temperature as measured by remote sensor.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Remote Sensor Under Temp Threshold	Threshold value used in the remote air sensor under temperature events.
Remote Sensor Under Temperature	[Remote Sensor Temperature] has dropped below [Remote Sensor Under Temp Threshold].
Reset Pump Speed Calibration	Fluid reset pump speed calibration
Return Air Over Temp - Event Control	Enable/disable the activation of the [Return Air Over Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Return Air Over Temp - Event Type	The event type for the [Return Air Over Temperature] event.
Return Air Over Temperature	Return air high temperature event.
Return Air Sensor Event Control	Enable/disable the activation of events related to measurements by the return air sensor.
Return Air Sensor Issue	The air sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Air Temperature Set Point	Desired air temperature at the inlet of the unit.
Return Air Temperature	The temperature of the inlet air
Return Air Under Temp - Event Control	Enable/disable the activation of the [Return Air Under Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Return Air Under Temp - Event Type	The event type for the [Return Air Under Temperature] event.
Return Air Under Temperature	[Return Air Temperature] has dropped below [Low Return Air Temperature Threshold].
Return Damper Status	Status of the return damper.
Return Dew Point	Dew point temperature measured at the inlet of the unit.
Return Fluid Low Temp	[Return Fluid Temperature] below Return Fluid Low Temp Threshold.
Return Fluid Over Temp Threshold	Threshold value used in the [Return Fluid Over Temp] event.
Return Fluid Over Temp	[Return Fluid Temperature] has exceeded a specified threshold.
Return Fluid Temp Sensor Issue	The return fluid temperature sensor is disconnected or the signal is out of range.
Return Fluid Temperature	Fluid temperature measured at the inlet of the unit.
Return Humidity Sensor Issue	The humidity sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Humidity Set Point	Desired relative humidity at the inlet of the unit.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Return Humidity	Relative humidity measured at the inlet of the unit.
Return Sensor Events Initial Delay	Amount of time after the unit's evaporator fan has powered on before any return sensor events are detected and annunciated.
Return Temp Hysteresis for Humidifier Disable	If return air temperature has exceeded [Return Temperature Threshold for Humidifier Disable], the humidifier will remain disabled until the temperature has dropped below the threshold minus this hysteresis value.
Return Temp Threshold for Humidifier Disable	If return air temperature exceeds this threshold, the humidifier will be disabled.
Slave Control Unit Communication Lost	The master control unit has lost Ethernet communications with the slave control unit.
Server Class	The general classification for this system
Service Required - Event Control	Enable/disable the activation of the [Service Required] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Service Required - Event Type	The event type for the [Service Required] event.
Service Required	Unit requires servicing.
Shutdown - Loss Of Power - Event Control	Enable/disable the activation of the [Shutdown - Loss Of Power] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Shutdown - Loss Of Power - Event Type	The event type for the [Shutdown - Loss Of Power] event.
Shutdown - Loss Of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power. This event remains active for 90 minutes.
Smoke Detected - Event Control	Enable/disable the activation of the [Smoke Detected] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Smoke Detected - Event Type	The event type for the [Smoke Detected] event.
Smoke Detected	Smoke detected.
SSA Control Input Issue	The analog input used to set the static pressure set point for fan speed control is disconnected or the signal is out of range.
Standby Units	The number of standby units.
Start Standby Units on High Temperature	Force the system to start all standby units if any unit in operation reports a high air temperature warning.
Static Pressure Fan Control	Static Pressure Fan Control type
Static Pressure Sensor Issue	The static pressure sensor is disconnected or the signal is out of range.
Static Pressure Sensor Out of Range	Static pressure sensor signal is out of its configured range.
Static Pressure Set Point	Desired static pressure.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Super Saver Call For Cooling	Call for cooling value used for Super Saver functionality. A higher call for cooling value indicates a need for a lower coolant temperature.
Supply Air Over Temperature	Supply air high temperature event.
Supply Air Over/Under Temperature - Event Control	Enable/disable the activation of the [Supply Air Over Temperature] and [Supply Air Under Temperature] events.
Supply Air Sensor Issue	The air sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Air Temperature Sensor Control	Control mode to be used with the supply air temperature sensor.
Supply Air Temperature Set Point	Desired supply air temperature.
Supply Air Temperature	Air temperature measured at the outlet of the unit.
Supply Air Under Temperature	Supply air low temperature event.
Supply Chilled Water Loss of Flow	Supply chilled water or glycol flow is too low.
Supply Chilled Water Over Temp	Chilled water temperature is too high, as indicated by an external input signal.
Supply Fan Communication Lost	Communications with Supply Fan has been lost
Supply Fan Emergency Op	Supply Fan Emergency Fan operate at communications disconnect
Supply Fan Measured Speed	Supply Fan Measured Speed
Supply Fluid Low Temp	[Supply Fluid Temperature] below Supply Fluid Low Temp Threshold.
Supply Fluid Over Temp Threshold	Threshold value used in the [Supply Fluid Over Temp] event.
Supply Fluid Over Temp	[Supply Fluid Temperature] has exceeded [Supply Fluid Over Temp Threshold].
Supply Fluid Temp Sensor Issue	The supply fluid temperature sensor is disconnected or the signal is out of range.
Supply Fluid Temperature	Supply fluid temperature.
Supply NTC Air Sensor Issue	The supply NTC air sensor is disconnected or the signal is out of range.
Supply Sensor Events Initial Delay	Amount of time after the unit's evaporator fan has powered on before any supply sensor events are detected and annunciated.
System Dew Point	System aggregated dew point

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
System Event Acknowledge/Reset	Reset and/or acknowledge all events.
System Fluid Cooling Capacity	Chiller system-level cooling capacity in use, expressed in kilowatts.
System Fluid Diff Pressure	Chiller system-level fluid differential pressure
System Fluid Flow	Chiller system-level fluid measured flow volume rate
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Input RMS Current Phase A	The system input RMS current for Phase A
System Input RMS Current Phase B	The system input RMS current for Phase B
System Input RMS Current Phase C	The system input RMS current for Phase C
System On/Off Control	Turn system functionality on or off.
System Static Pressure	Static pressure measurement among a group of interconnected units in a single system.
System Status	The operating status for the system
Tandem 'B' Compressor Hours	Operating hours for the 'B' compressor in a tandem configuration since last reset of this value.
Tandem 'B' Compressor State	Operational state for the 'B' compressor in a tandem configuration.
Team Static Pressure Sensor Failure	The team static pressure sensor is disconnected or the signal is out of range.
Teamwork Average Calculation Unit Count	If [Teamwork Temperature Calculation Method] is set to Average, this value specifies the maximum number of units in the Teamwork group used to calculate the average.
Teamwork Mode	Teamwork mode. Provides the ability to group multiple networked units for the purpose of operating based on shared system parameters.
Teamwork Temperature Calculation Method	Method used for calculating the single Teamwork Mode air temperature from the temperature sensor values provided by the units in the Teamwork group. Each unit provides a single air temperature sensor value.
Temperature Control Sensor Issue	The air sensor selected for cooling control is disconnected or the signal is out of range.
Thermal Control Override	If [Thermal Control Override] is enabled, this value sets the percent call for humidification or dehumidification.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
- Humidity Call	
Thermal Control Override - Humidity Control Type	If [Thermal Control Override] is enabled, this value selects if the humidity override is applied to humidification or dehumidification.
Thermal Control Override - Temperature Call	If [Thermal Control Override] is enabled, this value sets the percent call for cooling or heating.
Thermal Control Override - Temperature Control Type	If [Thermal Control Override] is enabled, this value selects if the temperature override is applied to cooling or heating.
Thermal Control Override	Override internal programmatic control of thermal conditions. This includes, but may not be limited to, temperature and humidity. The ability to enable this override may require additional system configuration.
Today's High Air Temperature Time	[Today's High Air Temperature] was measured at this time.
Today's High Air Temperature	The highest external air temperature measured since midnight.
Today's High Humidity Time	[Today's High Humidity] was measured at this time
Today's High Humidity	The highest external humidity measured since midnight.
Today's Low Air Temperature Time	[Today's Low Air Temperature] was measured at this time.
Today's Low Air Temperature	The lowest external air temperature measured since midnight.
Today's Low Humidity Time	[Today's Low Humidity] was measured at this time
Today's Low Humidity	The lowest external humidity measured since midnight.
TSA Control Input Issue	The analog input used to set the air temperature set point for cooling control is disconnected or the signal is out of range.
Underfloor Static Pressure Control Enable	Enable/disable the underfloor static pressure control.
Unit Calculated Airflow	Total airflow calculated for the unit.
Unit Cascade Control Delay	When a Teamwork unit transitions from 'standby' to 'running' due to cascading, its local control operations are delayed for this amount of time. Control operations can include, but are not limited to, heating, cooling, humidification, and/or dehumidification.
Unit Cascade On Delay	If [Unit Cascade Type] is set to anything other than 'No', and the measured value has reached the transition threshold, a Teamwork unit in 'standby' will transition to 'running' after delaying this amount of time.
Unit Cascade Type	If a unit is a member of a Teamwork group, it can be configured to cascade, i.e. automatically transition between 'standby' and 'running'. The decision of when to perform the transition is determined by comparing the value of this parameter type against a given transition threshold.
Unit Code Missing	Unit code has not been entered and saved.
Unit Communication Lost	Master has lost communication with one or more networked units.

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Unit Control Mode	Unit control mode.
Unit Cooling Load	The total amount of heat energy currently being removed by the unit.
Unit Dew Point	Unit aggregated dew point
Unit Fluid Cooling Capacity	Chiller unit-level cooling capacity in use, expressed in kilowatts.
Unit Fluid Diff Pressure	Chiller unit-level fluid differential pressure
Unit Fluid Flow	Chiller unit-level fluid measured flow volume rate
Unit Fluid Pump Speed	Chiller unit-level fluid pump speed
Unit Fluid Return Pressure	Chiller unit-level fluid return pressure
Unit Fluid Return Temperature	Chiller unit-level entering return fluid temperature
Unit Fluid Supply Pressure	Chiller unit-level fluid supply pressure
Unit Fluid Supply Temperature	Chiller unit-level leaving supply fluid temperature
Unit In Standby Due To Cooling Loss	Unit forced into standby because it is unable to provide any cooling.
Unit Off Reason	The reason the unit is turned off.
Unit Off	Unit was turned off.
Unit On	Unit was turned on.
Unit Operating State	Current operating state of the unit.
Unit Partial Shutdown	An event has occurred requiring some system components to be shutdown and disabled.
Unit Shutdown	An event has occurred requiring the unit to be shutdown and disabled to prevent damage to the system.
Unit Standby	Unit was placed in standby mode.
Unit Static Pressure	Static pressure measurement for a single unit.
Unspecified General Event	One or more unspecified events active. See local unit display for further details.
Valve Communications Failure	A valve is configured to exist but communications cannot be established.
Valve Issue	Valve is reporting abnormal operating condition.
Virtual Master Enable	Enable/disable the virtual master feature.
Water Leakage Detector Sensor Issue	The water leakage detector sensor is disconnected or the signal is out of range.
Water Leakage	Water Leakage - Typically indicates unit internal water leakage

Table 3.4 Liebert® Challenger 3000, Liebert® Challenger ITR, Liebert® CW, Liebert® CWA, Liebert® Deluxe System/3, Liebert® DS, Liebert® DSE, Liebert® HPM, Liebert® PeX, Liebert® PDX/PCW—Glossary (continued)

Data Label	Data Description
Water Under Floor - Event Control	Enable/disable the activation of the [Water Under Floor] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Water Under Floor - Event Type	The event type for the [Water Under Floor] event.
Water Under Floor	Water under the floor is detected.
XD Pump Communication Lost	Communications with XD Pump has been lost

NOTE:

[1] Any non-recognized alarm code by current firmware received from the DS control will trigger this event.

[2] Timer mode: 0= no, 1= yes.

[3] Type of DT Room-Glycol: 0= no, 1= contact, 2= value.

[4] Predictive Hum Control: 0= relative, 1= compensated, 2= predictive.

[5] Temp Control Algorithm: 0= proportional, 1= PD, 2= PD, 3= intelligent.

[6] When VFD is set to manual mode (coil 22), the host can control the VFD by the value of register 40019. The Manual VSD Timer will start to count down. Once it reaches 0, the VFD control mode will switch to auto. The host will need to periodically reset this timer in order to maintain the manual mode. Consult factory for BMS timer information.

[7] Operating State:

- **Bit 0-1:** 00 unit off, 01 unit on, 10 unit standby
- **Bit 2-3:** 00 auto, 01 manual
- **Bit 4-7:**
 - 0000 none,
 - 0001 local user,
 - 0010 alarm,
 - 0011 schedule,
 - 0100 remote user,
 - 0101 external device,
 - 0110 local display.

[8] Alarm state bit map:

- Bit0= Reset state,
- bit1= Active state,
- bit2= Acknowledge state,
- bit3-7= Alarm Type:
 - 00000: Message,
 - 00001: Warning,
 - 00010: Alarm.

[9] Free-cool state: 0= Off, 1= Start, 2= On.

Table 3.12 Liebert® CRV CR012—Glossary

Data Label	Data Description
Air Filter Hours	Operating hours for the air filter since last reset of this value.
Clogged Air Filter	Air filter is dirty and needs to be (cleaned or) replaced.
Compressor Control Mode	Compressor Control Mode
Compressor Discharge Superheat	Compressor discharge superheat value.
Compressor Discharge Temperature Sensor Failure	Compressor discharge temperature sensor is disconnected or the signal is out of range.
Compressor Discharge Temperature	Compressor discharge temperature value.
Compressor Drive Failure U00	Compressor Drive Failure U00
Compressor Drive Failure U01	Compressor Drive Failure U01
Compressor Drive Failure U02	Compressor Drive Failure U02
Compressor Drive Failure U03	Compressor Drive Failure U03
Compressor Drive Failure U04	Compressor Drive Failure U04
Compressor Drive Failure U05	Compressor Drive Failure U05
Compressor Drive Failure U06	Compressor Drive Failure U06
Compressor Drive Failure U07	Compressor Drive Failure U07
Compressor Drive Failure U08	Compressor Drive Failure U08
Compressor Drive Failure U09	Compressor Drive Failure U09
Compressor Drive Failure U10	Compressor Drive Failure U10
Compressor Drive Failure U11	Compressor Drive Failure U11
Compressor Drive Failure U12	Compressor Drive Failure U12
Compressor Drive Failure U13	Compressor Drive Failure U13
Compressor Drive Failure U14	Compressor Drive Failure U14
Compressor Drive Failure U15	Compressor Drive Failure U15
Compressor Driver Communication Failure	A communication failure occurred with the compressor driver board.
Compressor High Pressure	Compressor high pressure detected.
Compressor Hours	Operating hours for compressor since last reset of this value.
Compressor Low Pressure	Compressor low pressure detected.
Compressor Suction Superheat	Compressor suction superheat value.
Compressor Suction Temperature Sensor Failure	Compressor suction temperature sensor is disconnected or the signal is out of range.
Compressor Suction Temperature	Compressor suction temperature value.
Condensate Pump Hours	Condensate Pump Hours
Condenser Fan Speed	Condenser fan speed expressed as a percentage of the maximum rated speed.

Table 3.12 Liebert® CRV CR012—Glossary (continued)

Data Label	Data Description
Cooling Capacity (Master)	Compressor utilization or chilled water valve position, based on unit type.
Cooling Proportional Band	Temperature control band above [Air Temperature Set Point]. If measured air temperature is within this band, cooling operations are proportionally controlled.
Cooling State	Cooling operational state.
Dehumidifier State	Dehumidifier operational state.
EEV Driver Communication Failure	A communication failure occurred with the EEV driver board.
EEV Driver Unselect Refrigerant	EEV Driver Unselect Refrigerant
Electric Reheat State	Electric reheater operational state.
Electric Reheater Hours	Operating hours for electric reheater since last reset of this value.
Electrical Heater Failure	The electric heater temperature exceeded a threshold.
Ext Condenser Pump High Water	High water is detected in the condensate pump by the auxiliary float, as indicated by an external input signal.
Ext Remote Shutdown	Unit is shut down by a remote signal.
External Air Sensor Issue	The external air sensor is disconnected or the signal is out of range.
Fan Control Mode	Fan Control Mode
Fan Hours	Operating hours for fan since last reset of this value.
Fan Issue	One or more fans are not operating within their operational parameters.
Fan Speed	Fan speed expressed as a percentage of the maximum rated speed.
Filter Maintenance Due	The operating hours of the filter has exceeded the threshold and needs to be maintained or replaced.
High Compressor Discharge Temperature Lockout	Compressor Lockout occurred due to high compressor discharge temperature.
High Compressor Discharge Temperature	Compressor discharge temperature has exceeded a threshold.
High Compressor Pressure Lockout	Compressor lockout occurred due to high compressor pressure.
High Compressor Pressure Abnormal	Compressor pressure has exceeded a normal threshold.
High Compressor Pressure Sensor Failure	High compressor pressure sensor is disconnected or the signal is out of range.
High Compressor Pressure	Compressor pressure has exceeded a threshold.
High Return Humidity	[Return Humidity] has exceeded [High Return Humidity Threshold].
Humidification Proportional Band	Humidity control band below [Humidity Set Point]. If measured humidity is within this band, humidification operations are proportionally controlled.
Humidifier State	Humidifier operational state.
Humidity Set Point	Desired relative humidity.
Input Frequency Deviation	The input frequency is outside of the normal range.
Input Overvoltage	One or more of the input phase voltages has exceeded the limit.

Table 3.12 Liebert® CRV CR012—Glossary (continued)

Data Label	Data Description
Input Undervoltage	One or more of the input phase voltages has dropped below the limit.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Loss of Airflow Sensor Failure	Airflow sensor is disconnected or the signal is out of range.
Loss of Airflow	Loss of airflow detected.
Loss of Teamwork Slave	Teamwork Slave is offline or not connected to the network
Low Compressor Discharge Superheat Lockout	Compressor lockout occurred due to low compressor discharge superheat temperature.
Low Compressor Discharge Superheat	Compressor discharge superheat has dropped below a threshold.
Low Compressor Pressure Lockout	Compressor lockout occurred due to low compressor pressure.
Low Compressor Pressure Sensor Failure Lockout	Compressor lockout occurred due to low compressor pressure.
Low Compressor Pressure Sensor Failure	Low compressor pressure sensor is disconnected or the signal is out of range.
Low Compressor Pressure	Compressor pressure has dropped below a threshold.
Low Return Humidity	[Return Humidity] has dropped below [Low Return Humidity Threshold].
Monitoring ON/OFF	Monitoring ON/OFF
Power Loss Of Phase	One of the input phases has been lost.
Remote Sensor Air Temperature Set Point	Desired temperature monitored by the remote air temperature sensors.
Remote Sensor Temperature	Air temperature as measured by remote sensor.
Repeated Teamwork Address	The network address of two or more units in a teamwork are the same.
Return Air Over Temperature	Return air high temperature event.
Return Air Sensor Issue	The air sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Air Sensor Temperature	Air temperature measured at an inlet sensor.
Return Air Temperature Set Point	Desired air temperature at the inlet of the unit.
Return Humidity Sensor Issue	The humidity sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Sensor Humidity	Relative humidity measured at an inlet sensor.
Shutdown - Loss Of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power.
Supply Air Over Temperature	[Supply Air Temperature] has exceeded [High Supply Air Temperature Threshold].
Supply Air Sensor Issue	The air sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Air Sensor Temperature	Air temperature measured at an outlet sensor.
Supply Air Temperature Set Point	Desired supply air temperature.
Supply Air Under Temperature	Supply air low temperature event.
System Input Frequency	The system input frequency

Table 3.12 Liebert® CRV CR012—Glossary (continued)

Data Label	Data Description
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Lack Of Refrigerant	System Lack Of Refrigerant
System Operating State	System Operating State
System Status	The operating status for the system
Teamwork Master is offline or not connected to the network	Loss of Teamwork Master
Teamwork Status	Teamwork Status
Water Under Floor	Water under the floor is detected.

Table 3.15 Liebert® CRV CR025,CRD25,CRD35—Glossary

Data Label	Data Description
Air Filter Hours	Operating hours for the air filter since last reset of this value.
Clogged Air Filter	Air filter is dirty and needs to be (cleaned or) replaced.
Compressor Control Mode	Compressor Control Mode
Compressor Discharge Superheat	Compressor discharge superheat value.
Compressor Discharge Temperature Sensor Failure	Compressor discharge temperature sensor is disconnected or the signal is out of range.
Compressor Discharge Temperature	Compressor discharge temperature value.
Compressor Drive DC Power Abnormal	Compressor Drive DC Power Abnormal
Compressor Drive Heatsink High Temperature	Compressor Drive Heatsink High Temperature
Compressor Drive Over Current	Compressor Drive Over Current
Compressor Drive Phase Loss	Compressor Drive Phase Loss
Compressor Driver Communication Failure	A communication failure occurred with the compressor driver board.
Compressor Driver Failure	Compressor driver board failure detected.
Compressor High Pressure	Compressor high pressure detected.
Compressor Hours	Operating hours for compressor since last reset of this value.
Compressor Low Pressure	Compressor low pressure detected.
Compressor Suction Superheat	Compressor suction superheat value.
Compressor Suction Temperature Sensor Failure	Compressor suction temperature sensor is disconnected or the signal is out of range.
Compressor Suction Temperature	Compressor suction temperature value.
Condensate Pump Hours	Condensate Pump Hours
Cooling Capacity (Master)	Compressor utilization or chilled water valve position, based on unit type.
Cooling Proportional Band	Temperature control band above [Air Temperature Set Point]. If measured air temperature is within this band, cooling operations are proportionally controlled.
Cooling State	Cooling operational state.
Dehumidifier State	Dehumidifier operational state.
EEV Driver Communication Failure	A communication failure occurred with the EEV driver board.
EEV Driver Unselect Refrigerant	EEV Driver Unselect Refrigerant
Electric Reheat State	Electric reheater operational state.
Electric Reheater Hours	Operating hours for electric reheater since last reset of this value.
Electrical Heater Failure	The electric heater temperature exceeded a threshold.
Ext Condenser Pump High Water	High water is detected in the condensate pump by the auxiliary float, as indicated by an external input signal.

Table 3.15 Liebert® CRV CR025,CRD25,CRD35—Glossary (continued)

Data Label	Data Description
Ext Remote Shutdown	Unit is shut down by a remote signal.
External Air Sensor Issue	The external air sensor is disconnected or the signal is out of range.
Fan Control Mode	Fan Control Mode
Fan Hours	Operating hours for fan since last reset of this value.
Fan Issue	One or more fans are not operating within their operational parameters.
Fan Speed	Fan speed expressed as a percentage of the maximum rated speed.
Filter Maintenance Due	The operating hours of the filter has exceeded the threshold and needs to be maintained or replaced.
High Compressor Discharge Temperature Lockout	Compressor Lockout occurred due to high compressor discharge temperature.
High Compressor Discharge Temperature	Compressor discharge temperature has exceeded a threshold.
High Compressor Pressure Lockout	Compressor lockout occurred due to high compressor pressure.
High Compressor Pressure Abnormal	Compressor pressure has exceeded a normal threshold.
High Compressor Pressure Sensor Failure	High compressor pressure sensor is disconnected or the signal is out of range.
High Compressor Pressure	Compressor pressure has exceeded a threshold.
High Return Humidity	[Return Humidity] has exceeded [High Return Humidity Threshold].
Humidification Proportional Band	Humidity control band below [Humidity Set Point]. If measured humidity is within this band, humidification operations are proportionally controlled.
Humidifier Hours	Operating hours for humidifier since last reset of this value.
Humidifier Issue	Humidifier issue detected, causing it to be locked out.
Humidifier State	Humidifier operational state.
Humidity Set Point	Desired relative humidity.
Input Overvoltage	One or more of the input phase voltages has exceeded the limit.
Input Undervoltage	One or more of the input phase voltages has dropped below the limit.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Loss of Airflow Sensor Failure	Airflow sensor is disconnected or the signal is out of range.
Loss of Airflow	Loss of airflow detected.
Loss of Teamwork Slave	Teamwork Slave is offline or not connected to the network
Low Compressor Discharge Superheat Lockout	Compressor lockout occurred due to low compressor discharge superheat temperature.
Low Compressor Discharge Superheat	Compressor discharge superheat has dropped below a threshold.
Low Compressor Pressure Lockout	Compressor lockout occurred due to low compressor pressure.
Low Compressor Pressure Sensor Failure Lockout	Compressor lockout occurred due to low compressor pressure.

Table 3.15 Liebert® CRV CR025,CRD25,CRD35—Glossary (continued)

Data Label	Data Description
Low Compressor Pressure Sensor Failure	Low compressor pressure sensor is disconnected or the signal is out of range.
Low Compressor Pressure	Compressor pressure has dropped below a threshold.
Low Return Humidity	[Return Humidity] has dropped below [Low Return Humidity Threshold].
Monitoring ON/OFF	Monitoring ON/OFF
Power Loss Of Phase	One of the input phases has been lost.
Remote Sensor Air Temperature Set Point	Desired temperature monitored by the remote air temperature sensors.
Remote Sensor Temperature	Air temperature as measured by remote sensor.
Repeated Teamwork Address	The network address of two or more units in a teamwork are the same.
Return Air Over Temperature	Return air high temperature event.
Return Air Sensor Issue	The air sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Air Sensor Temperature	Air temperature measured at an inlet sensor.
Return Air Temperature Set Point	Desired air temperature at the inlet of the unit.
Return Humidity Sensor Issue	The humidity sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Sensor Humidity	Relative humidity measured at an inlet sensor.
Shutdown - Loss Of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power.
Supply Air Over Temperature	[Supply Air Temperature] has exceeded [High Supply Air Temperature Threshold].
Supply Air Sensor Issue	The air sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Air Sensor Temperature	Air temperature measured at an outlet sensor.
Supply Air Temperature Set Point	Desired supply air temperature.
Supply Air Under Temperature	Supply air low temperature event.
System Input Frequency	The system input frequency
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Lack Of Refrigerant	System Lack Of Refrigerant
System Operating State	System Operating State
System Status	The operating status for the system
Teamwork Master is offline or not connected to the network	Loss of Teamwork Master
Teamwork Status	Teamwork Status
Water Under Floor	Water under the floor is detected.

Table 3.18 Liebert® CRV CR030, CRC30, CRC60—Glossary

Data Label	Data Description
AC Power Supply Fail	A failure of the AC Power Supply has been detected.
Air Filter Hours	Operating hours for the air filter since last reset of this value.
Chilled Water Inlet Temperature Sensor Failure	Chilled water inlet temperature sensor is disconnected or the signal is out of range.
Chilled Water Inlet Temperature	Temperature of the water entering the hydraulic circuit of the chilled water unit.
Chilled Water Outlet Temperature Sensor Failure	Chilled water outlet temperature sensor is disconnected or the signal is out of range.
Chilled Water Outlet Temperature	Temperature of the water exiting the hydraulic circuit of the chilled water unit.
Chilled Water Valve Hours	Operating hours for chilled water valve since last reset of this value.
Chilled Water Valve Open Position	Chilled water valve open position.
Clogged Air Filter	Air filter is dirty and needs to be (cleaned or) replaced.
Condensate Pump Failure	Condensate Pump Failure
Condensate Pump Hours	Condensate Pump Hours
Cooling Proportional Band	Temperature control band above [Air Temperature Set Point]. If measured air temperature is within this band, cooling operations are proportionally controlled.
Cooling State	Cooling operational state.
Custom Alarm	Custom Alarm
DC Power Supply Fail	A failure of the DC Power Supply has been detected.
Dehumidifier State	Dehumidifier operational state.
Electric Reheat State	Electric reheater operational state.
Electric Reheater Hours	Operating hours for electric reheater since last reset of this value.
Electrical Heater Failure	The electric heater temperature exceeded a threshold.
Ext Condenser Pump High Water	High water is detected in the condensate pump by the auxiliary float, as indicated by an external input signal.
Ext Remote Shutdown	Unit is shut down by a remote signal.
External Air Sensor Issue	The external air sensor is disconnected or the signal is out of range.
External Fire Detected	Fire detected, as indicated by an external input signal.
External Humidity Sensor Issue	The external humidity sensor is disconnected or the signal is out of range.
Fan Control Mode	Fan Control Mode
Fan Detection Board Communication Failure	Communication with the fan detection board has failed.
Fan Hours Exceeded	Operating hours for the unit blower fan have exceeded the threshold.
Fan Hours	Operating hours for fan since last reset of this value.
Fan Issue	One or more fans are not operating within their operational parameters.
Fan Speed	Fan speed expressed as a percentage of the maximum rated speed.

Table 3.18 Liebert® CRV CR030, CRC30, CRC60—Glossary (continued)

Data Label	Data Description
Fan Static Pressure Sensor Failure	Fan static pressure sensor is disconnected or the signal is out of range.
Fan Static Pressure	Fan Static Pressure Measurement
Fan Temperature Difference Setpoint	Fan temperature difference setpoint.
Filter Maintenance Due	The operating hours of the filter has exceeded the threshold and needs to be maintained or replaced.
Filter Pressure Difference Sensor Failure	Filter pressure difference sensor is disconnected or the signal is out of range.
Fluid Flow Rate	Flow rate of fluid used for cooling.
Fluid Valve Hours Exceeded	Operating hours for the fluid valve have exceeded the threshold.
High Remote Air Humidity	Remote air humidity has exceeded a threshold.
High Return Humidity	[Return Humidity] has exceeded [High Return Humidity Threshold].
High Supply Air Humidity	Supply air humidity has exceeded a threshold.
Humidification Proportional Band	Humidity control band below [Humidity Set Point]. If measured humidity is within this band, humidification operations are proportionally controlled.
Humidifier Hours	Operating hours for humidifier since last reset of this value.
Humidifier Issue	Humidifier issue detected, causing it to be locked out.
Humidifier State	Humidifier operational state.
Humidity Set Point	Desired relative humidity.
Inlet Fluid Over Temp	Inlet fluid temperature has exceeded a threshold.
Inlet Fluid Pressure	The inlet water/fluid pressure.
Inlet Fluid Under Temp	Inlet fluid temperature has dropped below a threshold.
Input Frequency Deviation	The input frequency is outside of the normal range.
Input Overvoltage	One or more of the input phase voltages has exceeded the limit.
Input Undervoltage	One or more of the input phase voltages has dropped below the limit.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Loss of Airflow Sensor Failure	Airflow sensor is disconnected or the signal is out of range.
Loss of Airflow	Loss of airflow detected.
Loss of Teamwork Slave	Teamwork Slave is offline or not connected to the network
Low Remote Air Humidity	Remote air humidity has dropped below a threshold.
Low Return Humidity	[Return Humidity] has dropped below [Low Return Humidity Threshold].
Low Supply Air Humidity	Supply air humidity has dropped below a threshold.
Monitoring ON/OFF	Monitoring ON/OFF
Outlet Fluid Over Temp	Outlet fluid temperature has exceeded a threshold.
Outlet Fluid Pressure	The outlet water/fluid pressure.
Outlet Fluid Under Temp	Outlet fluid temperature has dropped below a threshold.

Table 3.18 Liebert® CRV CR030, CRC30, CRC60—Glossary (continued)

Data Label	Data Description
Power Loss Of Phase	One of the input phases has been lost.
Power Opposite Phase	The power input phases are incorrectly connected.
Relative Humidity	Relative Humidity measured at the humidity sensor
Remote Sensor Air Temperature Set Point	Desired temperature monitored by the remote air temperature sensors.
Remote Sensor Over Temperature	[Remote Sensor Temperature] has exceeded [Remote Sensor Over Temp Threshold].
Remote Sensor Temperature	Air temperature as measured by remote sensor.
Remote Sensor Under Temperature	[Remote Sensor Temperature] has dropped below [Remote Sensor Under Temp Threshold].
Repeated Teamwork Address	The network address of two or more units in a teamwork are the same.
Return Air Over Temperature	Return air high temperature event.
Return Air Sensor Issue	The air sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Air Sensor Temperature	Air temperature measured at an inlet sensor.
Return Air Temperature Set Point	Desired air temperature at the inlet of the unit.
Return Air Under Temperature	[Return Air Temperature] has dropped below [Low Return Air Temperature Threshold].
Return Humidity Sensor Issue	The humidity sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Sensor Humidity	Relative humidity measured at an inlet sensor.
Shutdown - Loss Of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power.
Smoke Detected	Smoke detected.
Supply Air Over Temperature	[Supply Air Temperature] has exceeded [High Supply Air Temperature Threshold].
Supply Air Sensor Issue	The air sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Air Sensor Temperature	Air temperature measured at an outlet sensor.
Supply Air Temperature Set Point	Desired supply air temperature.
Supply Air Under Temperature	Supply air low temperature event.
Supply Chilled Water Loss of Flow	Supply chilled water or glycol flow is too low.
Supply Fluid Low Flow	Supply fluid flow has dropped below a threshold.
Supply Humidity Sensor Issue	The humidity sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Sensor Humidity	Relative humidity measured at an outlet sensor.
Surge Protection Device Alarm	Surge Protection Device Alarm
System Input Frequency	The system input frequency
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral

Table 3.18 Liebert® CRV CR030, CRC30, CRC60—Glossary (continued)

Data Label	Data Description
System Operating State	System Operating State
System Status	The operating status for the system
Teamwork Master is offline or not connected to the network	Loss of Teamwork Master
Teamwork Status	Teamwork Status
Water Flow Sensor Failure	Water flow sensor is disconnected or the signal is out of range.
Water Pressure Sensor Failure	Water pressure sensor is disconnected or the signal is out of range.
Water Under Floor	Water under the floor is detected.
Water Valve Control Mode	Water Valve Control Mode
Water Valve Failure	There is an issue with the chilled water valve.

Table 3.23 Liebert® CRV—Glossary

Data Label	Data Description
Actual Auxiliary Air Temperature	Actual auxiliary air temperature value being used for control. This value may differ from the raw value received from the auxiliary device if filtering is applied.
Air Temperature Control Sensor	Sensor from which air temperature measurements will be used for cooling and heating control.
Air Temperature Dead Band	Value that is divided evenly to form a temperature range above and below [Air Temperature Set Point]. If measured air temperature is within this range, no heating or cooling will occur.
Air Temperature Set Point	Desired air temperature. This set point is dependent upon which sensor is selected for control.
Auto Restart Delay	If power is lost, the control will delay this amount of time after power is restored before restarting the unit.
Aux Air Temp Device Communication Lost	Communication with external auxiliary device providing an air temperature value has been lost.
Auxiliary Air Temperature Enable	Enable/disable the use of an external auxiliary air temperature value.
Auxiliary Proxy Status	Status of the proxy device providing the external auxiliary air temperature value.

Table 3.23 Liebert® CRV—Glossary (continued)

Data Label	Data Description
BMS Communications Timeout	Building Management System (or external monitoring system) has not communicated with the system within the expected timeframe.
BMS Timeout Period	Timeframe within which the Building Management System (or external monitoring system) must communicate with the system to avoid a timeout.
Bottom Fan Issue	The bottom fan is not operating within its normal parameters.
Calculated Next Maintenance Month	Calculated month of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Year].
Calculated Next Maintenance Year	Calculated year of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Month].
Chilled Water Control Valve Failure	Chilled water valve out of position. Chilled water control valve position does not match expected value.
Clogged Air Filter	Air filter is dirty and needs to be (cleaned or) replaced.
Compressor 1 High Head Pressure	Compressor 1 high head pressure.
Compressor 1 High Pressure Transducer Issue	Compressor 1 high pressure transducer is disconnected or the signal is out of range.
Compressor 1 Hours Exceeded	Operating hours for compressor 1 have exceeded the threshold.
Compressor 1 Low Pressure Transducer Issue	Compressor 1 low pressure transducer is disconnected or the signal is out of range.
Compressor 1 Low Suction Pressure	Compressor 1 low suction pressure.
Compressor 1 Pump Down Issue	Unable to pump down suction-side pressure during compressor 1 shutdown.
Compressor 1 Short Cycle	Compressor 1 short cycle. A short cycle is defined as turning on and off a number of times over a set time period.
Condenser 1 Issue - Event Control	Enable/disable the activation of the [Condenser 1 Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Condenser 1 Issue - Event Type	The event type for the [Condenser 1 Issue] event.
Condenser 1 Issue	Condenser 1 is not operating within its normal parameters.
Condenser Circuit Unspecified General Event	One or more unspecified condenser circuit events active. See local unit display for further details.
Condenser Low Noise Mode - Full Days	Days of the week selected for low noise mode full day scheduling.
Condenser Low Noise Mode - Interval Days	Days of the week selected for low noise mode interval scheduling.
Condenser Low Noise Mode Max Fan Speed	Maximum fan speed when condenser is placed in low noise mode.
Condenser Low Noise Mode Schedule Control	Enable/disable scheduled control of condenser low noise mode.
Condenser Low Noise Mode Start Time	The time of day at which the condenser will transition into low noise mode.
Condenser Low Noise Mode State	State of condenser low noise mode scheduler control.
Condenser Low Noise Mode Stop Time	The time of day at which the condenser will transition out of low noise mode.
Condenser Normal Mode Max Fan Speed	Maximum fan speed when condenser is not in low noise mode.

Table 3.23 Liebert® CRV—Glossary (continued)

Data Label	Data Description
Condenser TVSS Issue - Event Control	Enable/disable the activation of the [Condenser TVSS or SPD Issue] event (Transient Voltage Surge Suppressor or Surge Protection Device). If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Condenser TVSS Issue - Event Type	The event type for the [Condenser TVSS or SPD Issue] event (Transient Voltage Surge Suppressor or Surge Protection Device).
Condenser TVSS Issue	The condenser Transient Voltage Surge Suppressor or Surge Protection Device has failed.
Condenser Unit Unspecified General Event	One or more unspecified condenser unit events active. See local unit display for further details.
Condenser VFD Issue - Event Control	Enable/disable the activation of the [Condenser VFD Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Condenser VFD Issue - Event Type	The event type for the [Condenser VFD Issue] event.
Condenser VFD Issue	The condenser fan Variable Frequency Drive is offline.
Cooling Capacity (Master)	Compressor utilization or chilled water valve position, based on unit type.
Cooling Proportional Band	Temperature control band above [Air Temperature Set Point]. If measured air temperature is within this band, cooling operations are proportionally controlled.
Customer Input 1 - Event Control	Enable/disable the activation of the [Customer Input 1] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 1 - Event Type	The event type for the [Customer Input 1] event.
Customer Input 1	Customer Input 1.
Customer Input 2 - Event Control	Enable/disable the activation of the [Customer Input 2] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 2 - Event Type	The event type for the [Customer Input 2] event.
Customer Input 2	Customer input 2.
Customer Input 3 - Event Control	Enable/disable the activation of the [Customer Input 3] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 3 - Event Type	The event type for the [Customer Input 3] event.
Customer Input 3	Customer input 3.
Customer Input 4 - Event Control	Enable/disable the activation of the [Customer Input 4] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 4 - Event Type	The event type for the [Customer Input 4] event.
Customer Input 4	Customer input 4.
Dehumidification Proportional Band	Humidity control band above [Humidity Set Point]. If measured humidity is within this band, dehumidification operations are proportionally controlled.
Dehumidifier Hours Exceeded	Operating hours for the dehumidifier have exceeded the threshold.
Dehumidifier Utilization	Present dehumidifier utilization expressed as a percentage of the maximum rated capacity.

Table 3.23 Liebert® CRV—Glossary (continued)

Data Label	Data Description
Dig Scroll Comp 1 Over Temp	Digital scroll compressor 1 shut off because its head temperature has exceeded the upper threshold.
Dig Scroll Comp 1 Temp Sensor Issue	Digital scroll compressor 1 temperature sensor is disconnected or the signal is out of range.
Electric Reheater Hours Exceeded	Operating hours for electric reheater have exceeded the threshold.
Ext Compressor Lockout - Event Control	Enable/disable the activation of the [Ext Compressor Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Compressor Lockout - Event Type	The event type for the [Ext Compressor Lockout] event.
Ext Compressor Lockout	The compressor is shut down and disabled by an external input signal.
Ext Condenser Pump High Water	High water is detected in the condensate pump by the auxiliary float, as indicated by an external input signal.
Ext Humidifier Lockout - Event Control	Enable/disable the activation of the [Ext Humidifier Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Humidifier Lockout - Event Type	The event type for the [Ext Humidifier Lockout] event.
Ext Humidifier Lockout	The humidifier is shut down and disabled by an external input signal.
Ext Loss of Flow - Event Control	Enable/disable the activation of the [Ext Loss of Flow] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Loss of Flow - Event Type	The event type for the [Ext Loss of Flow] event.
Ext Loss of Flow	Loss of flow is detected, as indicated by an external input signal.
Ext Over Temperature - Event Control	Enable/disable the activation of the [Ext Over Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Over Temperature - Event Type	The event type for the [Ext Over Temperature] event.
Ext Over Temperature	A temperature has exceeded its threshold, as indicated by an external input signal.
Ext Reheat Lockout - Event Control	Enable/disable the activation of the [Ext Reheat Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Reheat Lockout - Event Type	The event type for the [Ext Reheat Lockout] event.
Ext Reheat Lockout	The reheater is shut down and disabled by an external input signal.
Ext Standby Glycol Pump On	The standby glycol pump is on, as indicated by an external input signal.
External Fire Detected	Fire detected, as indicated by an external input signal.
Fan Control Mode	Fan control mode. Allowable modes are: (0) Auto - Fan speed is controlled via the selected fan control sensor, and, (1) Manual - Fan will operate at a fixed speed.
Fan Control Sensor	Sensor from which air temperature measurements will be used for fan speed control.
Fan Hours Exceeded	Operating hours for the unit blower fan have exceeded the threshold.
Fan Speed Manual Set Point	Manual fan speed.

Table 3.23 Liebert® CRV—Glossary (continued)

Data Label	Data Description
Fan Speed Maximum Set Point	Maximum fan speed.
Fan Speed Minimum Set Point	Minimum fan speed.
Fan Speed Proportional Band	Temperature control band above the temperature set point calculated for proportional fan speed control. If measured air temperature is within this band, fan speed operations are proportionally controlled.
Fan Speed	Fan speed expressed as a percentage of the maximum rated speed.
Heating Proportional Band	Temperature control band below [Air Temperature Set Point]. If measured air temperature is within this band, heating operations are proportionally controlled.
High Power Shutdown	Supply to high power components has been shutdown.
High Return Air Temperature Threshold	Threshold value used in the [Return Air Over Temperature] event.
High Return Humidity Threshold	Threshold value used in the [High Return Humidity] event.
High Return Humidity	Return air high humidity event.
High Supply Air Temperature Threshold	Threshold value used in the [Supply Air Over Temperature] event.
High Supply Fluid Temperature Threshold	Threshold value used in the [Supply Chilled Water Over Temp] event.
Humidification Proportional Band	Humidity control band below [Humidity Set Point]. If measured humidity is within this band, humidification operations are proportionally controlled.
Humidifier Control Board Not Detected	Humidifier control board is required to be connected, but no signal is detected.
Humidifier Cylinder Worn	Humidifier cylinder is not operating properly and needs to be replaced.
Humidifier Hours Exceeded	Operating hours for the humidifier have exceeded the threshold.
Humidifier Issue	Humidifier issue detected, causing it to be locked out.
Humidifier Low Water	The water level in the humidifier has dropped below its threshold.
Humidifier Over Current	The electrical current to the humidifier has exceeded its upper threshold.
Humidifier Under Current	The electrical current to the humidifier has dropped below its lower threshold.
Humidifier Utilization	Present humidifier utilization expressed as a percentage of the maximum rated capacity.
Humidity Dead Band	Value that is divided evenly to form a range above and below [Humidity Set Point]. If measured humidity is within this range, no humidification or dehumidification will occur.
Humidity Set Point	Desired relative humidity.
Loss of Air Flow	No air flow through the unit due to failure of all fans.
Low Return Humidity Threshold	Threshold value used in the [Low Return Humidity] event.
Low Return Humidity	Return air low humidity event.
Low Supply Air Temperature Threshold	Threshold value used in the [Supply Air Under Temperature] event.
Maintenance Completed	Maintenance has been completed on the unit.
Maintenance Due	The calculated maintenance date has been reached.
Maintenance Ramp	The ratio of operations performed to the calculated operations available between maintenance intervals.

Table 3.23 Liebert® CRV—Glossary (continued)

Data Label	Data Description
Master Unit Communication Lost	Communication with master unit has been lost.
Operating Efficiency	The ratio of cooling energy provided to the amount of total energy being used.
RAM Battery Issue	RAM or RAM backup battery is not operating correctly.
Raw Auxiliary Air Temperature	Air temperature value sent by an external auxiliary device, with no additional filtering by the receiving system. This may be an aggregated value from multiple sensors.
Reheat Utilization	Present reheating utilization expressed as a percentage of the maximum rated capacity.
Reheater Over Temperature	The temperature of the reheater has exceeded its threshold.
Remote Sensor Average Temperature	Average value of remote sensor temperature measurements.
Remote Sensor Function	Function assigned to remote sensor. Available values are: (0) Control - sensor will be used in calculation of remote sensor temperature that may be used for heating and cooling control, (1) Reference - sensor will not be used in calculation of remote sensor temperature, but is enabled, (2) Disable - sensor is disabled
Remote Sensor Issue	Remote sensor is disconnected or the signal is out of range.
Remote Sensor Maximum Temperature	Maximum value of remote sensor temperature measurements.
Remote Sensor Minimum Temperature	Minimum value of remote sensor temperature measurements.
Remote Sensor Temperature Calculation	Calculation method applied to temperature readings from the remote sensors to determine a single temperature measurement value for cooling and heating control.
Remote Sensor Temperature	Air temperature as measured by remote sensor.
Return Air Over Temperature	Return air high temperature event.
Return Air Sensor Issue	The air sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Air Temperature	The temperature of the inlet air
Return Dew Point	Dew point temperature measured at the inlet of the unit.
Return Humidity Out Of Proportional Band	[Return Humidity] has exceeded the upper limit of [Dehumidification Proportional Band], or has dropped below the lower limit of [Humidification Proportional Band] , for an extended period of time.
Return Humidity	Relative humidity measured at the inlet of the unit.
Server Class	The general classification for this system
Service Required - Event Control	Enable/disable the activation of the [Service Required] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Service Required - Event Type	The event type for the [Service Required] event.
Service Required	Unit requires servicing.
Shutdown - Loss Of Power - Event Control	Enable/disable the activation of the [Shutdown - Loss Of Power] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Shutdown - Loss Of Power - Event Type	The event type for the [Shutdown - Loss Of Power] event.

Table 3.23 Liebert® CRV—Glossary (continued)

Data Label	Data Description
Shutdown - Loss Of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power. This event remains active for 90 minutes.
Smoke Detected - Event Control	Enable/disable the activation of the [Smoke Detected] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Smoke Detected - Event Type	The event type for the [Smoke Detected] event.
Smoke Detected	Smoke detected.
Super Saver Call For Cooling	Call for cooling value used for Super Saver functionality. A higher call for cooling value indicates a need for a lower coolant temperature.
Supply Air Over Temperature	Supply air high temperature event.
Supply Air Sensor Issue	The air sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Air Temperature	Air temperature measured at the outlet of the unit.
Supply Air Under Temperature	Supply air low temperature event.
Supply Chilled Water Loss of Flow	Supply chilled water or glycol flow is too low.
Supply Chilled Water Over Temp	[Supply Fluid Temperature] has exceeded [High Supply Fluid Temperature Threshold].
Supply Fluid Temp Sensor Issue	The supply fluid temperature sensor is disconnected or the signal is out of range.
Supply Fluid Temperature	Supply chilled water or glycol temperature.
Supply Humidity	Relative humidity at the outlet of the unit.
System Date and Time	The system date and time
System On/Off Control	Turn system functionality on or off.
System Status	The operating status for the system
Top Fan Issue	The top fan is not operating within its normal parameters.
Unit Control Mode	Unit control mode.
Unit Off	Unit was turned off.
Unit On	Unit was turned on.
Unit Operating State Reason	The reason the unit is in the current operating state.
Unit Operating State	Current operating state of the unit.
Unit Partial Shutdown	An event has occurred requiring some system components to be shutdown and disabled.
Unit Shutdown	An event has occurred requiring the unit to be shutdown and disabled to prevent damage to the system.
Unit Standby	Unit was placed in standby mode.
Unspecified General Event	One or more unspecified events active. See local unit display for further details.
Water Leakage Detector Sensor Issue	The water leakage detector sensor is disconnected or the signal is out of range.

Table 3.23 Liebert® CRV—Glossary (continued)

Data Label	Data Description
Water Under Floor - Event Control	Enable/disable the activation of the [Water Under Floor] event. If set to 'disabled', the event will not be announced. This implies that the event will not be placed in any active event list or in any event history list.
Water Under Floor - Event Type	The event type for the [Water Under Floor] event.
Water Under Floor	Water under the floor is detected.

Table 3.26 Vertiv™ Liebert® CRV4 Glossary

Data Label	Data Description
10DI Sensor Communication Fail	10DI Sensor Communication Fail
Air Filter Hours	Operating hours for the air filter since last reset of this value.
Clogged Air Filter	Air filter is dirty and needs to be (cleaned or) replaced.
Compressor Control Mode	Compressor Control Mode
Compressor Discharge Superheat	Compressor discharge superheat value.
Compressor Discharge Temperature Sensor Failure	Compressor discharge temperature sensor is disconnected, or the signal is out of range.
Compressor Discharge Temperature	Compressor discharge temperature value.
Compressor Drive Failure U00	Compressor Drive Failure U00
Compressor Drive Failure U01	Compressor Drive Failure U01
Compressor Drive Failure U02	Compressor Drive Failure U02
Compressor Drive Failure U03	Compressor Drive Failure U03
Compressor Drive Failure U04	Compressor Drive Failure U04
Compressor Drive Failure U05	Compressor Drive Failure U05
Compressor Drive Failure U06	Compressor Drive Failure U06
Compressor Drive Failure U07	Compressor Drive Failure U07
Compressor Drive Failure U08	Compressor Drive Failure U08
Compressor Drive Failure U09	Compressor Drive Failure U09

Table 3.26 Vertiv™ Liebert® CRV4 Glossary (continued)

Data Label	Data Description
Compressor Drive Failure U10	Compressor Drive Failure U10
Compressor Drive Failure U11	Compressor Drive Failure U11
Compressor Drive Failure U12	Compressor Drive Failure U12
Compressor Drive Failure U13	Compressor Drive Failure U13
Compressor Drive Failure U14	Compressor Drive Failure U14
Compressor Drive Failure U15	Compressor Drive Failure U15
Compressor Driver Communication Failure Lockout	Compressor lockout occurred due to multiple communication failures with the compressor driver board.
Compressor Driver Communication Failure	A communication failure occurred with the compressor driver board.
Compressor Driver Failure Lockout	Compressor lockout occurred due to multiple failures of the compressor driver board.
Compressor High Pressure	Compressor high pressure detected.
Compressor Hours	Operating hours for compressor since last reset of this value.
Compressor Low Pressure	Compressor low pressure detected.
Compressor Suction Superheat	Compressor suction superheat value.
Compressor Suction Temperature Sensor Failure	Compressor suction temperature sensor is disconnected, or the signal is out of range.
Compressor Suction Temperature	Compressor suction temperature value.
Condensate Pump Hours	Condensate Pump Hours
Cooling Capacity (Master)	Compressor utilization or chilled water valve position, based on unit type.
Cooling Proportional Band	Temperature control band above [Air Temperature Set Point]. If measured air temperature is within this band, cooling operations are proportionally controlled.
Cooling State	Cooling operational state.
Custom Alarm	Custom Alarm
Dehumidifier State	Dehumidifier operational state.
EEV Driver Communication Failure	A communication failure occurred with the EEV driver board.
EEV Driver Failure	EEV driver board failure detected.
Electric Reheat State	Electric reheat operational state.
Electric Reheater Hours	Operating hours for electric reheat since last reset of this value.
Electrical Heater Failure	The electric heater temperature exceeded a threshold.
Ext Condenser Pump High Water	High water is detected in the condensate pump by the auxiliary float, as indicated by an external input signal.
Ext Remote Shutdown	Unit is shut down by a remote signal.
External Air Sensor Issue	The external air sensor is disconnected, or the signal is out of range.
External Fire Detected	Fire detected, as indicated by an external input signal.

Table 3.26 Vertiv™ Liebert® CRV4 Glossary (continued)

Data Label	Data Description
External Humidity Sensor Issue	The external humidity sensor is disconnected, or the signal is out of range.
Fan Control Mode	Fan Control Mode
Fan Hours	Operating hours for fan since last reset of this value.
Fan Issue	One or more fans are not operating within their operational parameters.
Fan Speed	Fan speed expressed as a percentage of the maximum rated speed.
Fan Static Pressure Sensor Failure	Fan static pressure sensor is disconnected, or the signal is out of range.
Fan Static Pressure	Fan Static Pressure Measurement
Fan Temperature Difference Setpoint	Fan temperature difference setpoint.
Filter Maintenance Due	The operating hours of the filter has exceeded the threshold and needs to be maintained or replaced.
High Compressor Discharge Temperature Lockout	Compressor Lockout occurred due to high compressor discharge temperature.
High Compressor Discharge Temperature	Compressor discharge temperature has exceeded a threshold.
High Compressor Pressure Lockout	Compressor lockout occurred due to high compressor pressure.
High Compressor Pressure Abnormal	Compressor pressure has exceeded a normal threshold.
High Compressor Pressure Sensor Failure	High compressor pressure sensor is disconnected, or the signal is out of range.
High Compressor Pressure	Compressor pressure has exceeded a threshold.
High Remote Air Humidity	Remote air humidity has exceeded a threshold.
High Return Humidity	[Return Humidity] has exceeded [High Return Humidity Threshold].
Humidification Proportional Band	Humidity control band below [Humidity Set Point]. If measured humidity is within this band, humidification operations are proportionally controlled.
Humidifier Hours	Operating hours for humidifier since last reset of this value.
Humidifier Issue	Humidifier issue detected, causing it to be locked out.
Humidifier State	Humidifier operational state.
Humidity Set Point	Desired relative humidity.
Input Frequency Deviation	The input frequency is outside of the normal range.
Input Overvoltage	One or more of the input phase voltages has exceeded the limit.
Input Undervoltage	One or more of the input phase voltages has dropped below the limit.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Loss of Airflow Sensor Failure	Airflow sensor is disconnected, or the signal is out of range.
Loss of Airflow	Loss of airflow detected.
Loss of Teamwork Slave	Teamwork Slave is offline or not connected to the network

Table 3.26 Vertiv™ Liebert® CRV4 Glossary (continued)

Data Label	Data Description
Low Compressor Discharge Superheat Lockout	Compressor lockout occurred due to low compressor discharge superheat temperature.
Low Compressor Discharge Superheat	Compressor discharge superheat has dropped below a threshold.
Low Compressor Pressure Lockout	Compressor lockout occurred due to low compressor pressure.
Low Compressor Pressure Sensor Failure Lockout	Compressor lockout occurred due to low compressor pressure.
Low Compressor Pressure Sensor Failure	Low compressor pressure sensor is disconnected, or the signal is out of range.
Low Compressor Pressure	Compressor pressure has dropped below a threshold.
Low Remote Air Humidity	Remote air humidity has dropped below a threshold.
Low Return Humidity	[Return Humidity] has dropped below [Low Return Humidity Threshold].
Monitoring ON/OFF	Monitoring ON/OFF
Power Loss of Phase	One of the input phases has been lost.
Power Opposite Phase	The power input phases are incorrectly connected.
Relative Humidity	Relative Humidity measured at the humidity sensor
Remote Sensor Air Temperature Set Point	Desired temperature monitored by the remote air temperature sensors.
Remote Sensor Average Temperature	Average value of remote sensor temperature measurements.
Remote Sensor Over Temperature	[Remote Sensor Temperature] has exceeded [Remote Sensor Over Temp Threshold].
Remote Sensor Temperature	Air temperature as measured by remote sensor.
Remote Sensor Under Temperature	[Remote Sensor Temperature] has dropped below [Remote Sensor Under Temp Threshold].
Repeated Teamwork Address	The network address of two or more units in a teamwork are the same.
Return Air Over Temperature	Return air high temperature event.
Return Air Sensor Issue	The air sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Air Sensor Temperature	Air temperature measured at an inlet sensor.
Return Air Temperature Set Point	Desired air temperature at the inlet of the unit.
Return Air Temperature	The temperature of the inlet air
Return Air Under Temperature	[Return Air Temperature] has dropped below [Low Return Air Temperature Threshold].
Return Humidity Sensor Issue	The humidity sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Humidity	Relative humidity measured at the inlet of the unit.
Return Sensor Humidity	Relative humidity measured at an inlet sensor.
Shutdown - Loss of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power.
Smoke Detected	Smoke detected.
Supply Air Over Temperature	[Supply Air Temperature] has exceeded [High Supply Air Temperature Threshold].

Table 3.26 Vertiv™ Liebert® CRV4 Glossary (continued)

Data Label	Data Description
Supply Air Sensor Issue	The air sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Air Sensor Temperature	Air temperature measured at an outlet sensor.
Supply Air Temperature Set Point	Desired supply air temperature.
Supply Air Temperature	Air temperature measured at the outlet of the unit.
Supply Air Theoretical Humidity	This is a theoretical supply air humidity value which is calculated based on other values and is not a measurement directly from a humidity sensor.
Supply Air Under Temperature	Supply air low temperature event.
Supply Humidity Sensor Issue	The humidity sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Sensor Humidity	Relative humidity measured at an outlet sensor.
Surge Protection Device Alarm	Surge Protection Device Alarm
System Input Frequency	The system input frequency
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Operating State	System Operating State
Teamwork Master is offline or not connected to the network	Loss of Teamwork Master
Teamwork Status	Teamwork Status
Water Under Floor	Water under the floor is detected.

Table 3.29 Vertiv™ Liebert® CRV4-12 —Glossary

Data Label	Data Description
10DI Sensor Communication Fail	10DI Sensor Communication Fail
Air Filter Hours	Operating hours for the air filter since last reset of this value.
Clogged Air Filter	Air filter is dirty and needs to be (cleaned or) replaced.
Compressor Control Mode	Compressor Control Mode
Compressor Discharge Superheat	Compressor discharge superheat value.

Table 3.29 Vertiv™ Liebert® CRV4-12 —Glossary (continued)

Data Label	Data Description
Compressor Discharge Temperature Sensor Failure	Compressor discharge temperature sensor is disconnected or the signal is out of range.
Compressor Discharge Temperature	Compressor discharge temperature value.
Compressor Drive Failure U00	Compressor Drive Failure U00
Compressor Drive Failure U01	Compressor Drive Failure U01
Compressor Drive Failure U02	Compressor Drive Failure U02
Compressor Drive Failure U03	Compressor Drive Failure U03
Compressor Drive Failure U04	Compressor Drive Failure U04
Compressor Drive Failure U05	Compressor Drive Failure U05
Compressor Drive Failure U06	Compressor Drive Failure U06
Compressor Drive Failure U07	Compressor Drive Failure U07
Compressor Drive Failure U08	Compressor Drive Failure U08
Compressor Drive Failure U09	Compressor Drive Failure U09
Compressor Drive Failure U10	Compressor Drive Failure U10
Compressor Drive Failure U11	Compressor Drive Failure U11
Compressor Drive Failure U12	Compressor Drive Failure U12
Compressor Drive Failure U13	Compressor Drive Failure U13
Compressor Drive Failure U14	Compressor Drive Failure U14
Compressor Drive Failure U15	Compressor Drive Failure U15
Compressor Driver Communication Failure Lockout	Compressor lockout occurred due to multiple communication failures with the compressor driver board.
Compressor Driver Communication Failure	A communication failure occurred with the compressor driver board.
Compressor Driver Failure Lockout	Compressor lockout occurred due to multiple failures of the compressor driver board.
Compressor High Pressure	Compressor high pressure detected.
Compressor Hours	Operating hours for compressor since last reset of this value.
Compressor Low Pressure	Compressor low pressure detected.
Compressor Suction Superheat	Compressor suction superheat value.
Compressor Suction Temperature Sensor Failure	Compressor suction temperature sensor is disconnected or the signal is out of range.
Compressor Suction Temperature	Compressor suction temperature value.
Condensate Pump Hours	Condensate Pump Hours
Condenser Fan Speed	Condenser fan speed expressed as a percentage of the maximum rated speed.
Cooling Capacity (Master)	Compressor utilization or chilled water valve position, based on unit type.

Table 3.29 Vertiv™ Liebert® CRV4-12 —Glossary (continued)

Data Label	Data Description
Cooling Proportional Band	Temperature control band above [Air Temperature Set Point]. If measured air temperature is within this band, cooling operations are proportionally controlled.
Cooling State	Cooling operational state.
Custom Alarm	Custom Alarm
Dehumidifier State	Dehumidifier operational state.
EEV Driver Communication Failure	A communication failure occurred with the EEV driver board.
EEV Driver Failure	EEV driver board failure detected.
Electric Reheat State	Electric reheater operational state.
Electric Reheater Hours	Operating hours for electric reheater since last reset of this value.
Electrical Heater Failure	The electric heater temperature exceeded a threshold.
Ext Condenser Pump High Water	High water is detected in the condensate pump by the auxiliary float, as indicated by an external input signal.
Ext Remote Shutdown	Unit is shut down by a remote signal.
External Air Sensor Issue	The external air sensor is disconnected or the signal is out of range.
External Fire Detected	Fire detected, as indicated by an external input signal.
External Humidity Sensor Issue	The external humidity sensor is disconnected or the signal is out of range.
Fan Control Mode	Fan Control Mode
Fan Hours	Operating hours for fan since last reset of this value.
Fan Issue	One or more fans are not operating within their operational parameters.
Fan Speed	Fan speed expressed as a percentage of the maximum rated speed.
Fan Static Pressure Sensor Failure	Fan static pressure sensor is disconnected or the signal is out of range.
Fan Static Pressure	Fan Static Pressure Measurement
Fan Temperature Difference Setpoint	Fan temperature difference setpoint.
Filter Maintenance Due	The operating hours of the filter has exceeded the threshold and needs to be maintained or replaced.
High Compressor Discharge Temperature Lockout	Compressor Lockout occurred due to high compressor discharge temperature.
High Compressor Discharge Temperature	Compressor discharge temperature has exceeded a threshold.
High Compressor Pressure Lockout	Compressor lockout occurred due to high compressor pressure.
High Compressor Pressure Abnormal	Compressor pressure has exceeded a normal threshold.
High Compressor Pressure Sensor Failure	High compressor pressure sensor is disconnected or the signal is out of range.
High Compressor Pressure	Compressor pressure has exceeded a threshold.
High Remote Air Humidity	Remote air humidity has exceeded a threshold.
High Return Humidity	[Return Humidity] has exceeded [High Return Humidity Threshold].

Table 3.29 Vertiv™ Liebert® CRV4-12 —Glossary (continued)

Data Label	Data Description
Humidification Proportional Band	Humidity control band below [Humidity Set Point]. If measured humidity is within this band, humidification operations are proportionally controlled.
Humidifier Hours	Operating hours for humidifier since last reset of this value.
Humidifier Issue	Humidifier issue detected, causing it to be locked out.
Humidifier State	Humidifier operational state.
Humidity Set Point	Desired relative humidity.
Input Frequency Deviation	The input frequency is outside of the normal range.
Input Overvoltage	One or more of the input phase voltages has exceeded the limit.
Input Undervoltage	One or more of the input phase voltages has dropped below the limit.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Loss of Airflow Sensor Failure	Airflow sensor is disconnected or the signal is out of range.
Loss of Airflow	Loss of airflow detected.
Loss of Teamwork Slave	Teamwork Slave is offline or not connected to the network
Low Compressor Discharge Superheat Lockout	Compressor lockout occurred due to low compressor discharge superheat temperature.
Low Compressor Discharge Superheat	Compressor discharge superheat has dropped below a threshold.
Low Compressor Pressure Lockout	Compressor lockout occurred due to low compressor pressure.
Low Compressor Pressure Sensor Failure Lockout	Compressor lockout occurred due to low compressor pressure.
Low Compressor Pressure Sensor Failure	Low compressor pressure sensor is disconnected or the signal is out of range.
Low Compressor Pressure	Compressor pressure has dropped below a threshold.
Low Remote Air Humidity	Remote air humidity has dropped below a threshold.
Low Return Humidity	[Return Humidity] has dropped below [Low Return Humidity Threshold].
Monitoring ON/OFF	Monitoring ON/OFF
Power Loss Of Phase	One of the input phases has been lost.
Power Opposite Phase	The power input phases are incorrectly connected.
Relative Humidity	Relative Humidity measured at the humidity sensor
Remote Sensor Air Temperature Set Point	Desired temperature monitored by the remote air temperature sensors.
Remote Sensor Average Temperature	Average value of remote sensor temperature measurements.
Remote Sensor Over Temperature	[Remote Sensor Temperature] has exceeded [Remote Sensor Over Temp Threshold].
Remote Sensor Temperature	Air temperature as measured by remote sensor.
Remote Sensor Under Temperature	[Remote Sensor Temperature] has dropped below [Remote Sensor Under Temp Threshold].
Repeated Teamwork Address	The network address of two or more units in a teamwork are the same.

Table 3.29 Vertiv™ Liebert® CRV4-12 —Glossary (continued)

Data Label	Data Description
Return Air Over Temperature	Return air high temperature event.
Return Air Sensor Issue	The air sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Air Sensor Temperature	Air temperature measured at an inlet sensor.
Return Air Temperature Set Point	Desired air temperature at the inlet of the unit.
Return Air Temperature	The temperature of the inlet air
Return Air Under Temperature	[Return Air Temperature] has dropped below [Low Return Air Temperature Threshold].
Return Humidity Sensor Issue	The humidity sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Humidity	Relative humidity measured at the inlet of the unit.
Return Sensor Humidity	Relative humidity measured at an inlet sensor.
Shutdown - Loss Of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power.
Smoke Detected	Smoke detected.
Supply Air Over Temperature	[Supply Air Temperature] has exceeded [High Supply Air Temperature Threshold].
Supply Air Sensor Issue	The air sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Air Sensor Temperature	Air temperature measured at an outlet sensor.
Supply Air Temperature Set Point	Desired supply air temperature.
Supply Air Temperature	Air temperature measured at the outlet of the unit.
Supply Air Theoretical Humidity	This is a theoretical supply air humidity value which is calculated based on other values and is not a measurement directly from a humidity sensor.
Supply Air Under Temperature	Supply air low temperature event.
Supply Humidity Sensor Issue	The humidity sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Sensor Humidity	Relative humidity measured at an outlet sensor.
Surge Protection Device Alarm	Surge Protection Device Alarm
System Input Frequency	The system input frequency
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Operating State	System Operating State
Teamwork Master is offline or not connected to the network	Loss of Teamwork Master
Teamwork Status	Teamwork Status
Water Under Floor	Water under the floor is detected.

Table 3.32 Vertiv™ Liebert® CAHU - Glossary

Data Label	Data Description
Air Filter Differential Pressure Sensor Failure	Air Filter Differential Pressure Sensor Failure
Air Filter Hours	Operating hours for the air filter since last reset of this value.
Aisle Static Pressure Sensor Failure	Aisle static pressure sensor failure
APF Communication Failure	Active Power Filter Communication Failure

Table 3.32 Vertiv™ Liebert® CAHU - Glossary (continued)

Data Label	Data Description
ATS Communication Failure	ATS Communication Failure
Average Relative Humidity	Average value of humidity sensor measurements.
BMS Communications Timeout	Building Management System (or external monitoring system) has not communicated with the system within the expected timeframe.
BMS Fan Speed Setting	Fan speed setting when under the manual control of the Building Management System.
BPHE Communication Failure	Brazed Plate Heat Exchanger Communication Failure
BPHE Valve Feedback	Brazed Plate Heat Exchanger Valve Feedback Status
BPHE Valve Opening	Brazed Plate Heat Exchanger Valve Opening
Chilled Water Inlet Temperature	Temperature of the water entering the hydraulic circuit of the chilled water unit.
Chilled Water Outlet Temperature	Temperature of the water exiting the hydraulic circuit of the chilled water unit.
Chilled Water Valve Hours	Operating hours for chilled water valve since last reset of this value.
Chilled Water Valve Open Position	Chilled water valve open position.
Clogged Air Filter	Air filter is dirty and needs to be (cleaned or) replaced.
Compressor Control Mode	Compressor Control Mode
Compressor Discharge Superheat	Compressor discharge superheat value.
Compressor Discharge Temperature Sensor Failure	Compressor discharge temperature sensor is disconnected or the signal is out of range.
Compressor Discharge Temperature	Compressor discharge temperature value.
Compressor Driver Communication Failure Lockout	Compressor lockout occurred due to multiple communication failures with the compressor driver board.
Compressor Driver Communication Failure	A communication failure occurred with the compressor driver board.
Compressor Driver Failure Lockout	Compressor lockout occurred due to multiple failures of the compressor driver board.
Compressor Driver Failure	Compressor driver board failure detected.
Compressor High Pressure	Compressor high pressure detected.
Compressor Hours	Operating hours for compressor since last reset of this value.
Compressor in Alarm Condition	Compressor in Alarm Condition
Compressor Instantaneous Power	Compressor Instantaneous Power
Compressor Low Pressure	Compressor low pressure detected.
Compressor Pressure Difference Lockout	Compressor lockout occurred due to multiple compressor pressure differences.
Compressor Pressure Difference	Compressor pressure difference is out of range.
Compressor Status	Compressor Status
Compressor Suction Superheat	Compressor suction superheat value.

Table 3.32 Vertiv™ Liebert® CAHU - Glossary (continued)

Data Label	Data Description
Compressor Suction Temperature Sensor Failure	Compressor suction temperature sensor is disconnected or the signal is out of range.
Compressor Suction Temperature	Compressor suction temperature value.
Cooling Capacity (Master)	Compressor utilization or chilled water valve position, based on unit type.
Cooling Proportional Band	Temperature control band above [Air Temperature Set Point]. If measured air temperature is within this band, cooling operations are proportionally controlled.
Cooling State	Cooling operational state.
Current Heartbeat Timer	Current Heartbeat Timer
Custom Alarm	Custom Alarm
Data Collector Communication Failure	Data Collector Communication Failure
Dehumidifier State	Dehumidifier operational state.
EEV Driver Communication Failure	A communication failure occurred with the EEV driver board.
EEV Driver Failure	EEV driver board failure detected.
Electric Reheat State	Electric reheater operational state.
Electric Reheater Hours	Operating hours for electric reheater since last reset of this value.
Electrical Heater Failure	The electric heater temperature exceeded a threshold.
Emergency Cooling	Emergency Cooling
EPIV Failure	Electronic Pressure Independent Control Valve Failure
Ext Condenser Pump High Water	High water is detected in the condensate pump by the auxiliary float, as indicated by an external input signal.
Ext Remote Shutdown	Unit is shut down by a remote signal.
External Air Sensor Issue	The external air sensor is disconnected or the signal is out of range.
External Fire Detected	Fire detected, as indicated by an external input signal.
External Humidity Sensor Issue	The external humidity sensor is disconnected or the signal is out of range.
Fan Communication Failure	Fan Communication Failure
Fan Control Mode	Fan Control Mode
Fan Control Status	Fan Control Status
Fan Control	Fan Control
Fan Hours	Operating hours for fan since last reset of this value.
Fan Issue	One or more fans are not operating within their operational parameters.
Fan Speed Minimum Set Point	Minimum fan speed.
Fan Speed	Fan speed expressed as a percentage of the maximum rated speed.
Fan Static Pressure Sensor Failure	Fan static pressure sensor is disconnected or the signal is out of range.
Fan Static Pressure	Fan Static Pressure Measurement

Table 3.32 Vertiv™ Liebert® CAHU - Glossary (continued)

Data Label	Data Description
Filter Maintenance Due	The operating hours of the filter has exceeded the threshold and needs to be maintained or replaced.
Filter Pressure Difference Sensor Failure	Filter pressure difference sensor is disconnected or the signal is out of range.
Fluid Flow Rate	Flow rate of fluid used for cooling.
Heartbeat Timer Setpoint	Heartbeat Timer Setpoint
High Compressor Discharge Temperature Lockout	Compressor Lockout occurred due to high compressor discharge temperature.
High Compressor Discharge Temperature	Compressor discharge temperature has exceeded a threshold.
High Compressor Pressure Lockout	Compressor lockout occurred due to high compressor pressure.
High Compressor Pressure Abnormal	Compressor pressure has exceeded a normal threshold.
High Compressor Pressure Sensor Failure	High compressor pressure sensor is disconnected or the signal is out of range.
High Compressor Pressure	Compressor pressure has exceeded a threshold.
High Remote Air Humidity	Remote air humidity has exceeded a threshold.
High Return Humidity	[Return Humidity] has exceeded [High Return Humidity Threshold].
Humidification Proportional Band	Humidity control band below [Humidity Set Point]. If measured humidity is within this band, humidification operations are proportionally controlled.
Humidifier Hours	Operating hours for humidifier since last reset of this value.
Humidifier Issue	Humidifier issue detected, causing it to be locked out.
Humidifier State	Humidifier operational state.
Humidity Set Point	Desired relative humidity.
Inlet Fluid Over Temp	Inlet fluid temperature has exceeded a threshold.
Inlet Fluid Under Temp	Inlet fluid temperature has dropped below a threshold.
Input Frequency Deviation	The input frequency is outside of the normal range.
Input Overvoltage	One or more of the input phase voltages has exceeded the limit.
Input Undervoltage	One or more of the input phase voltages has dropped below the limit.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Loss of Airflow Sensor Failure	Airflow sensor is disconnected or the signal is out of range.
Loss of Airflow	Loss of airflow detected.
Loss of Teamwork Slave	Teamwork Slave is offline or not connected to the network
Low Compressor Discharge Superheat Lockout	Compressor lockout occurred due to low compressor discharge superheat temperature.
Low Compressor Discharge Superheat	Compressor discharge superheat has dropped below a threshold.
Low Compressor Pressure Abnormal	Compressor pressure has dropped below a normal threshold.

Table 3.32 Vertiv™ Liebert® CAHU - Glossary (continued)

Data Label	Data Description
Low Compressor Pressure Lockout	Compressor lockout occurred due to low compressor pressure.
Low Compressor Pressure Sensor Failure	Low compressor pressure sensor is disconnected or the signal is out of range.
Low Compressor Pressure	Compressor pressure has dropped below a threshold.
Low Remote Air Humidity	Remote air humidity has dropped below a threshold.
Low Return Humidity	[Return Humidity] has dropped below [Low Return Humidity Threshold].
Lower Module Supply Air Average Temperature	Average supply air temperature for the lower module.
Monitoring ON/OFF	Monitoring ON/OFF
Motorized Ball Valve Failure	Motorized Ball Valve Failure
Power Factor	Power Factor
Power Loss Of Phase	One of the input phases has been lost.
Power Opposite Phase	The power input phases are incorrectly connected.
Master Power Source Status	Master Power Source Status
Relative Humidity	Relative Humidity measured at the humidity sensor
Remote Sensor Air Temperature Set Point	Desired temperature monitored by the remote air temperature sensors.
Remote Sensor Average Temperature	Average value of remote sensor temperature measurements.
Remote Sensor Over Temperature	[Remote Sensor Temperature] has exceeded [Remote Sensor Over Temp Threshold].
Remote Sensor Temperature	Air temperature as measured by remote sensor.
Remote Sensor Under Temperature	[Remote Sensor Temperature] has dropped below [Remote Sensor Under Temp Threshold].
Repeated Teamwork Address	The network address of two or more units in a teamwork are the same.
Return Air Over Temperature	Return air high temperature event.
Return Air Sensor Issue	The air sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Air Sensor Temperature	Air temperature measured at an inlet sensor.
Return Air Temperature Set Point	Desired air temperature at the inlet of the unit.
Return Air Temperature	The temperature of the inlet air
Return Air Under Temperature	[Return Air Temperature] has dropped below [Low Return Air Temperature Threshold].
Return Humidity Sensor Issue	The humidity sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Humidity	Relative humidity measured at the inlet of the unit.
Return Sensor Humidity	Relative humidity measured at an inlet sensor.
Slave Power Source Status	Slave Power Source Status
Shutdown - Loss Of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power.
Smoke Detected	Smoke detected.

Table 3.32 Vertiv™ Liebert® CAHU - Glossary (continued)

Data Label	Data Description
Supply Air Dewpoint Temperature	Supply Air Dewpoint Temperature
Supply Air Flowrate	Supply Air Flowrate
Supply Air Over Temperature	[Supply Air Temperature] has exceeded [High Supply Air Temperature Threshold].
Supply Air Sensor Issue	The air sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Air Sensor Temperature	Air temperature measured at an outlet sensor.
Supply Air Temperature Set Point	Desired supply air temperature.
Supply Air Temperature	Air temperature measured at the outlet of the unit.
Supply Air Theoretical Humidity	This is a theoretical supply air humidity value which is calculated based on other values and is not a measurement directly from a humidity sensor.
Supply Air Under Temperature	Supply air low temperature event.
Supply Air Volume Sensor Communication Failure	Supply Air Volume Sensor Communication Failure
Supply Fluid Low Flow	Supply fluid flow has dropped below a threshold.
Supply Humidity Sensor Issue	The humidity sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Humidity	Relative humidity at the outlet of the unit.
Supply Sensor Humidity	Relative humidity measured at an outlet sensor.
System Input Frequency	The system input frequency
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Operating State	System Operating State
Teamwork Master is offline or not connected to the network	Loss of Teamwork Master
Teamwork Status	Teamwork Status
Total Input THDI Phase A	Total Input THDI Phase A
Total Input THDI Phase B	Total Input THDI Phase B
Total Input THDI Phase C	Total Input THDI Phase C
Upper Module Supply Air Average Temperature	Average supply air temperature for the upper module.
Water Flow Sensor Failure	Water flow sensor is disconnected or the signal is out of range.
Water Under Floor	Water under the floor is detected.
Water Valve Control Mode	Water Valve Control Mode
Water Valve Failure	There is an issue with the chilled water valve.
Water Valve Feedback	Water Valve Feedback Status

Temperature Tolerance	—	40350	1	1000	Multiply desired value by 1000 (Modbus only) 0=No Change (W)
Humidity Setpoint	—	40351	1	-	(W)
Humidity Tolerance	—	40351	1	100	Multiply desired value by 100 (Modbus only) 0=No Change (W)
Reheat Lockout	—	40349	1	—	Bit 2 On=RH Off; Bit 3 On=RH On*
Humidifier Lockout	—	40349	1	—	Bit 4 On=HL Off; Bit 5 On=HL On*
If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.					
* These bit pairs use an exclusive function of OR. Both bits in the pair cannot be set or unset. Multiple pairs may be set/unset in a single write, as long as the exclusive function of OR is appropriately recognized.

Table 3.40 Liebert® DCP—Glossary

Data Label	Data Description
Auto Restart Delay	If power is lost, the control will delay this amount of time after power is restored before restarting the unit.
Calculated Next Maintenance Month	Calculated month of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Year].
Calculated Next Maintenance Year	Calculated year of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Month].
Chilled Water Control Valve Position	Chilled water valve out of position. Chilled water control valve position does not match expected value.
Cold Aisle Over Temp Threshold	Upper threshold value used in the [Cold Aisle Temp Out of Range] event.
Cold Aisle Temp Out of Range	The air temperature in the cold aisle is either above [Cold Aisle Over Temp Threshold] or below [Cold Aisle Under Temp Threshold].
Cold Aisle Under Temp Threshold	Lower threshold value used in the [Cold Aisle Temp Out of Range] event.
Communication Status	Communication status of remote device.
Cooling Capacity	Cooling capacity in use, expressed as a percentage of the maximum rated capacity.
Cooling Capacity	Cooling capacity in use, expressed in kilowatts.
Customer Input 1	Customer input 1.

Table 3.40 Liebert® DCP—Glossary (continued)

Data Label	Data Description
Dew Point Temperature	Dew point temperature, using the highest reading from all sensors.
Ext Air Over Temp Threshold	Threshold value used in the ([Ext Air Sensor A Over Temperature], [Ext Air Sensor B Over Temperature]...) events.
Ext Air Sensor A Dew Point Temp	Dew point temperature as measured by external air sensor A.
Ext Air Sensor A Humidity	Relative humidity as measured by external air sensor A.
Ext Air Sensor A Issue	The external air sensor A is disconnected or the signal is out of range.
Ext Air Sensor A Over Temperature	[Ext Air Sensor A Temperature] has exceeded [Ext Air Over Temp Threshold].
Ext Air Sensor A Temperature	Air temperature as measured by external air sensor A.
Ext Air Sensor A Under Temperature	[Ext Air Sensor A Temperature] has dropped below [Ext Air Under Temp Threshold].
Ext Air Sensor B Dew Point Temp	Dew point temperature as measured by external air sensor B.
Ext Air Sensor B Humidity	Relative humidity as measured by external air sensor B.
Ext Air Sensor B Issue	The external air sensor B is disconnected or the signal is out of range.
Ext Air Sensor B Over Temperature	[Ext Air Sensor B Temperature] has exceeded [Ext Air Over Temp Threshold].
Ext Air Sensor B Temperature	Air temperature as measured by external air sensor B.
Ext Air Sensor B Under Temperature	[Ext Air Sensor B Temperature] has dropped below [Ext Air Under Temp Threshold].
Ext Air Under Temp Threshold	Threshold value used in the ([Ext Air Sensor A Under Temperature], [Ext Air Sensor B Under Temperature]...) events.
Ext Dew Point Over Temp Threshold	Threshold value used in the [Ext Dew Point Over Temperature] event.
Ext Dew Point Over Temperature	At least one dew point temperature reading ([Ext Air Sensor A Dew Point Temp], [Ext Air Sensor B Dew Point Temp]...) has exceeded [Ext Dew Point Over Temp Threshold].
Ext Fan Issue - Event Control	Enable/disable the activation of the [Ext Fan Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Fan Issue - Event Type	The event type for the [Ext Fan Issue] event.
Ext Fan Issue	One or more fans are not operating within their operational parameters.
Ext Remote Shutdown - Event Control	Enable/disable the activation of the [Remote Shutdown] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Remote Shutdown - Event Type	The event type for the [Remote Shutdown] event.
Ext Remote Shutdown	Unit is shut down by a remote signal.
Ext System Condensation Detected - Event Control	Enable/disable the activation of the [Ext System Condensation Detected] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext System Condensation Detected - Event Type	The event type for the [Ext System Condensation Detected] event.
Ext System Condensation Detected	External system condensation detected.

Table 3.40 Liebert® DCP—Glossary (continued)

Data Label	Data Description
Fan Button Control	Enable or disable the buttons from controlling the state of the fans.
Fan Economy Mode	Mode in which system slave fans are to be controlled.
Fan Issue	One or more fans are not operating within their operational parameters.
Fan On/Off Control	Turn system fans on or off.
Fan State	Current operational state of a group of fans.
High Supply Fluid Temperature Threshold	Threshold value used in the [Supply Chilled Water Over Temp] event.
Hot Aisle Over Temp Threshold	Upper threshold value used in the [Hot Aisle Temp Out of Range] event.
Hot Aisle Temp Out of Range	The air temperature in the Hot aisle is either above [Hot Aisle Over Temp Threshold] or below [Hot Aisle Under Temp Threshold].
Hot Aisle Under Temp Threshold	Lower threshold value used in the [Hot Aisle Temp Out of Range] event.
Maintenance Completed	Maintenance has been completed on the unit.
Maintenance Due	The calculated maintenance date has been reached.
Maintenance Ramp	The ratio of operations performed to the calculated operations available between maintenance intervals.
Master Unit Communication Lost	Communication with master unit has been lost.
Minimum Room Temperature Set Point	Minimum desired room air temperature. If the room air temperature falls below this set point, the unit will reduce the cooling.
Master Fan Group State	Current operational state of the master fan group.
Pump 1 Loss of Flow	Loss of flow is detected in pump 1. The loss of flow condition occurs when no differential pressure is detected across the pump.
Pump 1 State	Pump 1 operational state.
Pump 2 Loss of Flow	Loss of flow is detected in pump 2. The loss of flow condition occurs when no differential pressure is detected across the pump.
Pump 2 State	Pump 2 operational state.
Pump Hours Exceeded	[Pump Hours] has exceeded [Pump Hours Threshold].
Pump Hours Threshold	Threshold value used in the [Pump Hours Exceeded] event.
Pump Hours	Operating hours for pump since last reset of this value.
Pump Short Cycle	Pumps have short cycled. A short cycle is defined as turning on and off a number of times over a set time period.
RAM Battery Issue	RAM or RAM backup battery is not operating correctly.
Remote Sensor Temperature	Air temperature as measured by remote sensor.
Remote Shutdown	Unit is shut down by a remote signal.
Sensor Issue - Event Control	Enable/disable the activation of the [Sensor Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Sensor Issue - Event Type	The event type for the [Sensor Issue] event.

Table 3.40 Liebert® DCP—Glossary (continued)

Data Label	Data Description
Sensor Issue	One or more sensors are disconnected or the signals are out of range.
Service Required	Unit requires servicing.
Shutdown - Loss Of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power.
Smoke Detected	Smoke detected.
Supply Chilled Water Over Temp	[Supply Fluid Temperature] has exceeded [High Supply Fluid Temperature Threshold].
Supply Chilled Water Temp Sensor Issue	The supply chilled water temperature sensor is disconnected or the signal is out of range.
Supply Fluid Over Temp Threshold	Threshold value used in the [Supply Fluid Over Temp] event.
Supply Fluid Over Temp	[Supply Fluid Temperature] has exceeded [Supply Fluid Over Temp Threshold].
Supply Fluid Temp Sensor Issue	The supply fluid temperature sensor is disconnected or the signal is out of range.
Supply Fluid Temperature	Supply chilled water or glycol temperature.
Supply Fluid Temperature	Supply fluid temperature.
Supply Fluid Under Temp	[Supply Fluid Temperature] has dropped below a specified threshold.
System Condensation Detected	System condensation detected.
System Date and Time	The system date and time
System On/Off Control	Turn system functionality on or off.
System Status	The operating status for the system
Unit Code Missing	Unit code has not been entered and saved.
Unit Communication Lost	Master has lost communication with one or more networked units.
Unit Control Mode	Unit control mode.
Unit Off Reason	The reason the unit is turned off.
Unit Off	Unit was turned off.
Unit On	Unit was turned on.
Unit Operating State	Current operating state of the unit.
Unit Partial Shutdown	An event has occurred requiring some system components to be shutdown and disabled.
Unit Shutdown	An event has occurred requiring the unit to be shutdown and disabled to prevent damage to the system.
Unit Standby	Unit was placed in standby mode.
Visual ID Control	Visual identification control to display an LED flashing sequence, allowing it to be visually located.
Water Under Floor	Water under the floor is detected.

Table 3.43 Vertiv™ Liebert® DME2 - Glossary

Data Label	Data Description
Compressor Hours	Operating hours for compressor since last reset of this value.
Condensate Fan Hours	Condensate Fan Hours
Condensate Pressure Sensor Alarm	Condensate Pressure Sensor Alarm
Cooling Proportional Band	Temperature control band above [Air Temperature Set Point]. If measured air temperature is within this band, cooling operations are proportionally controlled.
Cooling State	Cooling operational state.
Custom Alarm	Custom Alarm
Dehumidifier State	Dehumidifier operational state.
Electric Reheat State	Electric reheat operational state.
Electric Reheater Hours	Operating hours for electric reheat since last reset of this value.
Electrical Heater Failure	The electric heater temperature exceeded a threshold.
Ext Remote Shutdown	Unit is shut down by a remote signal.
Fan Hours Exceeded	Operating hours for the unit blower fan have exceeded the threshold.
Fan Hours	Operating hours for fan since last reset of this value.
Fan Speed	Fan speed expressed as a percentage of the maximum rated speed.

Table 3.43 Vertiv™ Liebert® DME2 - Glossary (continued)

Data Label	Data Description
Filter Maintenance Due	The operating hours of the filter has exceeded the threshold and needs to be maintained or replaced.
High Compressor Discharge Temperature Lockout	Compressor Lockout occurred due to high compressor discharge temperature.
High Compressor Discharge Temperature	Compressor discharge temperature has exceeded a threshold.
High Compressor Pressure Lockout	Compressor lockout occurred due to high compressor pressure.
High Compressor Pressure	Compressor pressure has exceeded a threshold.
High Return Humidity	[Return Humidity] has exceeded [High Return Humidity Threshold].
Humidification Proportional Band	Humidity control band below [Humidity Set Point]. If measured humidity is within this band, humidification operations are proportionally controlled.
Humidifier Hours Exceeded	Operating hours for the humidifier have exceeded the threshold.
Humidifier Hours	Operating hours for humidifier since last reset of this value.
Humidifier Issue	Humidifier issue detected, causing it to be locked out.
Humidifier State	Humidifier operational state.
Humidity Set Point	Desired relative humidity.
Input Frequency Deviation	The input frequency is outside of the normal range.
Input Overvoltage	One or more of the input phase voltages has exceeded the limit.
Input Undervoltage	One or more of the input phase voltages has dropped below the limit.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Loss of Airflow Sensor Failure	Airflow sensor is disconnected or the signal is out of range.
Loss of Airflow	Loss of airflow detected.
Loss of Teamwork Slave	Teamwork Slave is offline or not connected to the network
Low Compressor Pressure Lockout	Compressor lockout occurred due to low compressor pressure.
Low Compressor Pressure	Compressor pressure has dropped below a threshold.
Low Return Humidity	[Return Humidity] has dropped below [Low Return Humidity Threshold].
Monitoring ON/OFF	Monitoring ON/OFF
Power Loss Of Phase	One of the input phases has been lost.
Power Opposite Phase	The power input phases are incorrectly connected.
Repeated Teamwork Address	The network address of two or more units in a teamwork are the same.
Return Air Over Temperature	Return air high temperature event.
Return Air Sensor Issue	The air sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Air Sensor Temperature	Air temperature measured at an inlet sensor.
Return Air Temperature Set Point	Desired air temperature at the inlet of the unit.
Return Air Under Temperature	[Return Air Temperature] has dropped below [Low Return Air Temperature Threshold].

Table 3.43 Vertiv™ Liebert® DME2 - Glossary (continued)

Data Label	Data Description
Return Humidity Sensor Issue	The humidity sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Sensor Humidity	Relative humidity measured at an inlet sensor.
Shutdown - Loss Of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power.
Surge Protection Device Alarm	Surge Protection Device Alarm
System Input Frequency	The system input frequency
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Operating State	System Operating State
Teamwork Master is offline or not connected to the network	Loss of Teamwork Master
Teamwork Status	Teamwork Status
Water Under Floor	Water under the floor is detected.
Input Undervoltage	Binary_Value
Input Overvoltage	Binary_Value
Input Frequency Deviation	Binary_Value
Surge Protection Device Alarm	Binary_Value
Power Opposite Phase	Binary_Value
Power Loss Of Phase	Binary_Value
Repeated Teamwork Address	The network address of two or more units in a teamwork are the same.
Power Opposite Phase	The power input phases are incorrectly connected.
Return Air Over Temperature	Return air high temperature event.
Return Air Sensor Issue	The air sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Air Sensor Temperature	Air temperature measured at an inlet sensor.
Return Air Temperature Set Point	Desired air temperature at the inlet of the unit.
Return Air Under Temperature	[Return Air Temperature] has dropped below [Low Return Air Temperature Threshold].
Return Humidity Sensor Issue	The humidity sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Sensor Humidity	Relative humidity measured at an inlet sensor.
Shutdown - Loss Of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power.
Surge Protection Device Alarm	Surge Protection Device Alarm
System Input Frequency	The system input frequency
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral

Table 3.43 Vertiv™ Liebert® DME2 - Glossary (continued)

Data Label	Data Description
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Operating State	System Operating State
Teamwork Master is offline or not connected to the network	Loss of Teamwork Master
Teamwork Status	Teamwork Status
Water Under Floor	Water under the floor is detected.

<i>If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.</i>					

Table 3.46 Extra Notes Key to Liebert® HPC (Chiller)—Status and Coil on page 310

Number	Description
1	This point is supported on iCOM Controller Version 2.02.xxx.
2	This point is supported on iCOM Controller Version 2.03.xxx.

Table 3.47 Liebert® HPC (Chiller)—Glossary

Data Label	Data Description
Actual Supply Fluid Temp Set Point	The actual set point value being used for the desired fluid temperature at the outlet of the unit.
All Pumps Loss of Flow	System is shut down due to loss of flow in all available pumps.
Ambient Air Temperature Sensor Issue	The ambient air temperature sensor is disconnected or the signal is out of range.

Table 3.47 Liebert® HPC (Chiller)—Glossary (continued)

Data Label	Data Description
Ambient Air Temperature	Ambient air temperature.
Compressor Capacity Control State	Compressor capacity control state. When 'ON', the cooling capacity of the compressor has been reduced.
Compressor Capacity Normal	Compressor has returned to normal load capacity.
Compressor Capacity Reduced	Compressor capacity has been reduced.
Compressor Contactor Issue	Compressor contactor is not closing during compressor startup or is not opening during compressor shutdown.
Compressor Economizer Utilization	Present compressor economizer utilization expressed as a percentage of the maximum.
Compressor Head Pressure	Compressor head pressure.
Compressor High Head Pressure	Compressor is shut down due to high head pressure.
Compressor Hours Exceeded	[Compressor Hours] has exceeded [Compressor Hours Threshold].
Compressor Hours Threshold	Threshold value used in the [Compressor Hours Exceeded] event.
Compressor Hours	Operating hours for compressor since last reset of this value.
Compressor Loss of Differential Pressure	Compressor is shut down due to low differential pressure.
Compressor Low Oil Pressure	Compressor low oil pressure.
Compressor Low Suction Pressure	Compressor is shut down due to low suction pressure.
Compressor Not Stopping	Compressor commanded to stop, but continues to run.
Compressor Shut Down - Ambient Air Low Temp Limit	When the temperature of ambient air falls below this lower threshold, the compressor will be shut off. Correct condensing pressure cannot be achieved when temperature is too low.
Compressor State	Compressor operational state.
Compressor Superheat Over Threshold	Compressor discharge refrigerant superheat temperature has exceeded an upper threshold.
Compressor Thermal Overload	Compressor is shut down due to thermal overload.
Compressor Utilization	Present compressor utilization expressed as a percentage of the maximum rated capacity.
Condenser Adiabatic Cooling Utilization	Present adiabatic cooling utilization expressed as a percentage of the maximum.
Condenser Fan Issue	Condenser fan is not operating within its operational parameters.
Condenser Fan Speed	Condenser fan speed expressed as a percentage of the maximum rated speed.
Condenser Inlet Water Temperature	For water cooled condensers, the temperature of the water entering the heat exchanger, before cooling the refrigerant.
Condenser Max Fan Speed Override	Fan speed exceeding the maximum set point in order to alleviate a high temperature or pressure condition.
Condenser Outlet Water Temperature	For water cooled condensers, the temperature of the water exiting the heat exchanger, after cooling the refrigerant.
Customer Input 1	Customer input 1.
Customer Input 2	Customer input 2.

Table 3.47 Liebert® HPC (Chiller)—Glossary (continued)

Data Label	Data Description
Customer Input 3	Customer input 3.
Customer Input 4	Customer input 4.
EEV Unspecified General Event	One or more unspecified electronic expansion valve events active. See local unit display for further details.
Energy Consumption	Energy consumption since the last reset of this value.
Evaporator Fluid Freeze - Auto Reset	Evaporator outlet fluid temperature has dropped below the freeze threshold. Evaporator has been shut down, but will restart when the temperature rises above the threshold.
Evaporator Fluid Freeze - Manual Reset Required	Evaporator outlet fluid temperature has dropped below the freeze threshold. Evaporator has been shut down and requires a manual reset.
Evaporator Inlet Temp Sensor Issue	The evaporator inlet temperature sensor is disconnected or the signal is out of range.
Evaporator Return Fluid Over Temp Alarm Threshold	Alarm threshold value used in the [Evaporator Return Fluid Over Temp] event.
Evaporator Return Fluid Over Temp Warning Threshold	Warning threshold value used in the [Evaporator Return Fluid Over Temp] event.
Evaporator Return Fluid Over Temp	[Evaporator Return Fluid Temperature] has exceeded a threshold. The event is deactivated when the temperature drops below the threshold.
Evaporator Return Fluid Temperature	Fluid temperature measured at the inlet of the evaporator.
Evaporator Return Fluid Under Temp Alarm Threshold	Alarm threshold value used in the [Evaporator Return Fluid Under Temp] event.
Evaporator Return Fluid Under Temp Warning Threshold	Warning threshold value used in the [Evaporator Return Fluid Under Temp] event.
Evaporator Return Fluid Under Temp	[Evaporator Return Fluid Temperature] has dropped below a threshold. The event is deactivated when the temperature rises above the threshold.
Fluid Cooling Proportional Band	Temperature control band above [Actual Supply Fluid Temp Set Point]. If [Return Fluid Temperature] is within this band, fluid cooling operations are proportionally controlled.
Fluid Pressure	Fluid pressure. This is the pressure within a closed water/glycol circuit.
Free Cooling External Temperature Delta	Minimum temperature delta required between return fluid and external ambient air temperatures in order to enable free cooling.
Free Cooling Status	Free cooling status.
Free Cooling Utilization	Present free cooling utilization expressed as a percentage of the maximum.
Free Cooling Valve Hours Exceeded	[Free Cooling Valve Hours] has exceeded [Free Cooling Valve Hours Threshold].
Free Cooling Valve Hours Threshold	Threshold value used in the [Free Cooling Valve Hours Exceeded] event.
Free Cooling Valve Hours	Operating hours for free cooling valve since last reset of this value.
Free Cooling Valve Open Position	Free cooling valve open position.
Humidifier Control Board Not Detected	Humidifier control board is required to be connected, but no signal is detected.
Instantaneous Power	Total electrical power currently being consumed.

Table 3.47 Liebert® HPC (Chiller)—Glossary (continued)

Data Label	Data Description
Low Condenser Refrigerant Pressure	Refrigerant pressure in condenser coil is too low.
Low Fluid Pressure	[Fluid Pressure] has dropped below a specified threshold.
Master Unit Communication Lost	Communication with master unit has been lost.
Modbus Power Meter Communication Lost	Communication with Modbus power meter has been lost.
Output Power Factor	Total power factor, real power/apparent power for all phases combined
Pump 1 Loss of Flow	Loss of flow is detected in pump 1. This condition occurs when no flow is detected through the flow switch.
Pump 1 State	Pump 1 operational state.
Pump 2 Loss of Flow	Loss of flow is detected in pump 2. This condition occurs when no flow is detected through the flow switch.
Pump 2 State	Pump 2 operational state.
Pump Hours Exceeded	[Pump Hours] has exceeded [Pump Hours Threshold].
Pump Hours Threshold	Threshold value used in the [Pump Hours Exceeded] event.
Pump Hours	Operating hours for pump since last reset of this value.
RAM Battery Issue	RAM or RAM backup battery is not operating correctly.
Reheat Utilization	Present reheating utilization expressed as a percentage of the maximum rated capacity.
Return Fluid Temp Sensor Issue	The return fluid temperature sensor is disconnected or the signal is out of range.
Return Fluid Temperature	Fluid temperature measured at the inlet of the unit.
Server Class	The general classification for this system
Standby Units	The number of standby units.
Subgroup Event Occurred During Communication Loss	While subgroup unit communication was lost, an event occurred on the subgroup unit. Please check subgroup unit event log.
Supply Brine Temp Set Point	Desired brine fluid temperature at the outlet of the unit.
Supply Fluid Over Temp Alarm Threshold	Threshold value used to generate a [Supply Fluid Over Temp] alarm.
Supply Fluid Over Temp	[Supply Fluid Temperature] has exceeded a specified threshold.
Supply Fluid Temp Sensor Issue	The supply fluid temperature sensor is disconnected or the signal is out of range.
Supply Fluid Temp Set Point 1	Set point 1 of desired fluid temperature at the outlet of the unit.
Supply Fluid Temp Set Point 2	Set point 2 of desired fluid temperature at the outlet of the unit.
Supply Fluid Temperature	Fluid temperature measured at the outlet of the unit.
Supply Fluid Under Temp Alarm Threshold	Threshold value used to generate a [Supply Fluid Under Temp] alarm.
Supply Fluid Under Temp	[Supply Fluid Temperature] has dropped below a specified threshold.
Supply Heated Water Temp Set Point	Desired heated water temperature at the outlet of the unit.

Table 3.47 Liebert® HPC (Chiller)—Glossary (continued)

Data Label	Data Description
Supply Refrigerant Temp Sensor Issue	The supply refrigerant temperature sensor is disconnected or the signal is out of range.
System Control Mode	System control mode.
System Date and Time	The system date and time
System Event Acknowledge/Reset	Reset and/or acknowledge all events.
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Input RMS Current Phase A	The system input RMS current for Phase A
System Input RMS Current Phase B	The system input RMS current for Phase B
System Input RMS Current Phase C	The system input RMS current for Phase C
System On/Off Control	Turn system functionality on or off.
System Operating State Reason	The reason the system is in the current operating state.
System Operating State	Current operating state of the system.
System Status	The operating status for the system
Unit Code Missing	Unit code has not been entered and saved.
Unit Off	Unit was turned off.
Unit On	Unit was turned on.
Unit Shutdown Unspecified General Event	One or more unspecified unit shutdown events active. See local unit display for further details.
Unspecified General Event	One or more unspecified events active. See local unit display for further details.

Table 3.50 Liebert® iCOM™ DCL—Glossary

Data Label	Data Description
Air Temperature Control Sensor	Sensor from which air temperature measurements will be used for cooling and heating control.
Air Temperature Dead Band	Value that is divided evenly to form a temperature range above and below [Air Temperature Set Point]. If measured air temperature is within this range, no heating or cooling will occur.
Air Temperature Set Point	Desired air temperature. This set point is dependent upon which sensor is selected for control.
Auto Restart Delay	If power is lost, the control will delay this amount of time after power is restored before restarting the unit.
BMS Communications Timeout	Building Management System (or external monitoring system) has not communicated with the system within the expected timeframe.
BMS Timeout Period	Timeframe within which the Building Management System (or external monitoring system) must communicate with the system to avoid a timeout.
Bottom Fan Issue	The bottom fan is not operating within its normal parameters.
Calculated Next	Calculated month of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Year].

Table 3.50 Liebert® iCOM™ DCL—Glossary (continued)

Data Label	Data Description
Maintenance Month	
Calculated Next Maintenance Year	Calculated year of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Month].
Chilled Water Auto Valve Rotation	If enabled, the priority of the chilled water valves will change daily.
Chilled Water Control Active	Chilled water inlet temperature control function is enabled due to 'bad' water.
Chilled Water Control Valve Failure	Chilled water valve out of position. Chilled water control valve position does not match expected value.
Chilled Water Flow Transducer Failure	Chilled water flow transducer is disconnected or the signal is out of range.
Chilled Water High Inlet Temperature	Chilled water inlet temperature has exceeded an upper threshold.
Chilled Water Inlet High Temperature Threshold	Defines the threshold for considering the inlet water temperature too high.
Chilled Water Inlet Temperature Control	Enable/disable the function to switch off the fan and open the chilled water valve in case of 'bad' inlet water.
Chilled Water Inlet Temperature Hysteresis	Hysteresis used before returning to standard control mode when [Chilled Water Inlet Temperature Control] is enabled.
Chilled Water Inlet Temperature Sensor Failure	Chilled water inlet temperature sensor is disconnected or the signal is out of range. The sensor is mandatory for the chilled water flow function.
Chilled Water Inlet Temperature	Temperature of the water entering the hydraulic circuit of the chilled water unit.
Chilled Water Main Valve	Specifies which of the two chilled water valves is the main valve.
Chilled Water Outlet Temperature	Temperature of the water exiting the hydraulic circuit of the chilled water unit.
Chilled Water Valve Control	Method for controlling the chilled water cooling capacity. The options available are: single, parallel, alternate and cascade.
Chilled Water Valve Open Position	Chilled water valve open position.
Chilled Water Valve Rotation Hour	Hour of the day for switching the priority of the valves.
Cooling Capacity	Cooling capacity in use, expressed as a percentage of the maximum rated capacity.
Cooling Proportional Band	Temperature control band above [Air Temperature Set Point]. If measured air temperature is within this band, cooling operations are proportionally controlled.
Customer Input 1 - Event Control	Enable/disable the activation of the [Customer Input 1] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 1 - Event Type	The event type for the [Customer Input 1] event.

Table 3.50 Liebert® iCOM™ DCL—Glossary (continued)

Data Label	Data Description
Customer Input 1	Customer Input 1.
Customer Input 2 - Event Control	Enable/disable the activation of the [Customer Input 2] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 2 - Event Type	The event type for the [Customer Input 2] event.
Customer Input 2	Customer input 2.
Customer Input 3 - Event Control	Enable/disable the activation of the [Customer Input 3] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 3 - Event Type	The event type for the [Customer Input 3] event.
Customer Input 3	Customer input 3.
Customer Input 4 - Event Control	Enable/disable the activation of the [Customer Input 4] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 4 - Event Type	The event type for the [Customer Input 4] event.
Customer Input 4	Customer input 4.
Dehumidifier Hours Exceeded	Operating hours for the dehumidifier have exceeded the threshold.
Dehumidifier State	Dehumidifier operational state.
Dehumidifier Utilization	Present dehumidifier utilization expressed as a percentage of the maximum rated capacity.
Energy Consumption	Energy consumption since the last reset of this value.
Ext Condenser Pump High Water	High water is detected in the condensate pump by the auxiliary float, as indicated by an external input signal.
Ext Loss of Flow - Event Control	Enable/disable the activation of the [Ext Loss of Flow] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Loss of Flow - Event Type	The event type for the [Ext Loss of Flow] event.
Ext Loss of Flow	Loss of flow is detected, as indicated by an external input signal.
Ext Over Temperature - Event Control	Enable/disable the activation of the [Ext Over Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Over Temperature - Event Type	The event type for the [Ext Over Temperature] event.
Ext Over Temperature	A temperature has exceeded its threshold, as indicated by an external input signal.
Ext Standby Glycol Pump On	The standby glycol pump is on, as indicated by an external input signal.
External Fire Detected	Fire detected, as indicated by an external input signal.
Fan Control Mode	Fan control mode. Allowable modes are: (0) Auto - Fan speed is controlled via the selected fan control sensor, and, (1) Manual - Fan will operate at a fixed speed.

Table 3.50 Liebert® iCOM™ DCL—Glossary (continued)

Data Label	Data Description
Fan Control Sensor	Sensor from which air temperature measurements will be used for fan speed control.
Fan Hours Exceeded	Operating hours for the unit blower fan have exceeded the threshold.
Fan Speed Manual Set Point	Manual fan speed.
Fan Speed Maximum Set Point	Maximum fan speed.
Fan Speed Minimum Set Point	Minimum fan speed.
Fan Speed Proportional Band	Temperature control band above the temperature set point calculated for proportional fan speed control. If measured air temperature is within this band, fan speed operations are proportionally controlled.
Fan Speed	Fan speed expressed as a percentage of the maximum rated speed.
High Power Shutdown	Supply to high power components has been shutdown.
High Return Air Temperature Threshold	Threshold value used in the [Return Air Over Temperature] event.
High Return Humidity Threshold	Threshold value used in the [High Return Humidity] event.
High Return Humidity	Return air high humidity event.
High Supply Air Temperature Threshold	Threshold value used in the [Supply Air Over Temperature] event.
High Supply Fluid Temperature Threshold	Threshold value used in the [Supply Chilled Water Over Temp] event.
Humidity Set Point	Desired relative humidity.
Instantaneous Power	Total electrical power currently being consumed.
Loss of Air Flow	No air flow through the unit due to failure of all fans.
Low Return Humidity Threshold	Threshold value used in the [Low Return Humidity] event.
Low Return Humidity	Return air low humidity event.
Low Supply Air Temperature Threshold	Threshold value used in the [Supply Air Under Temperature] event.
Maintenance Completed	Maintenance has been completed on the unit.
Maintenance Due	The calculated maintenance date has been reached.
Maintenance Ramp	The ratio of operations performed to the calculated operations available between maintenance intervals.
Modbus 0-10V Module Communication Failure	Modbus 0-10V module for managing the second Chilled Water circuit valve is disconnected or the signal is out of range.
Pipe Temperature Dead Band	Value that is divided evenly to form a temperature range above and below [Pipe Temperature Set Point]. If measured air temperature is within this range, the fan speed will not change.
Pipe Temperature Sensor Failure	Air temperature sensor located in the pipe is not sending a valid value.

Table 3.50 Liebert® iCOM™ DCL—Glossary (continued)

Data Label	Data Description
Pipe Temperature Set Point	This value will be used as a comparison against pipe air temperature measurements in order to manage the speed of the fans.
Rack Door Open High Supply Air Temperature Threshold	If the rack supply air temperature exceeds this threshold, the rack doors are opened.
Rack Door Open Sensor Selection	Specifies the temperature sensor to be used by the control to manage the automatic rack door opening function.
Rack Doors Open	Rack doors opened due to supply air temperature exceeding the [Rack Door Open High Supply Air Temperature Threshold].
RAM Battery Issue	RAM or RAM backup battery is not operating correctly.
Remote Sensor Average Temperature	Average value of remote sensor temperature measurements.
Remote Sensor Function	Function assigned to remote sensor. Available values are: (0) Control - sensor will be used in calculation of remote sensor temperature that may be used for heating and cooling control, (1) Reference - sensor will not be used in calculation of remote sensor temperature, but is enabled, (2) Disable - sensor is disabled
Remote Sensor Issue	Remote sensor is disconnected or the signal is out of range.
Remote Sensor Maximum Temperature	Maximum value of remote sensor temperature measurements.
Remote Sensor Minimum Temperature	Minimum value of remote sensor temperature measurements.
Remote Sensor Temperature Calculation	Calculation method applied to temperature readings from the remote sensors to determine a single temperature measurement value for cooling and heating control.
Remote Sensor Temperature	Air temperature as measured by remote sensor.
Return Air Over Temperature	Return air high temperature event.
Return Air Sensor Issue	The air sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Air Temperature	The temperature of the inlet air
Return Dew Point	Dew point temperature measured at the inlet of the unit.
Return Humidity	Relative humidity measured at the inlet of the unit.
Return Temperature/Humidity Sensor Control Type	Specifies whether the average, maximum, or only one of the return sensor values is to be used for return humidity and temperature control.
Server Class	The general classification for this system
Service Required - Event Control	Enable/disable the activation of the [Service Required] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Service Required - Event Type	The event type for the [Service Required] event.
Service Required	Unit requires servicing.
Smoke Detected - Event Control	Enable/disable the activation of the [Smoke Detected] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.

Table 3.50 Liebert® iCOM™ DCL—Glossary (continued)

Data Label	Data Description
Smoke Detected - Event Type	The event type for the [Smoke Detected] event.
Smoke Detected	Smoke detected.
Supply Air Over Temperature	Supply air high temperature event.
Supply Air Sensor Issue	The air sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Air Temperature	Air temperature measured at the outlet of the unit.
Supply Air Under Temperature	Supply air low temperature event.
Supply Chilled Water Loss of Flow	Supply chilled water or glycol flow is too low.
Supply Humidity	Relative humidity at the outlet of the unit.
Supply Temperature Sensor Control Type	Specifies whether the average, maximum, or only one of the supply sensor values is to be used for supply temperature control.
System Date and Time	The system date and time
System Event Acknowledge/Reset	Reset and/or acknowledge all events.
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Input RMS Current Phase A	The system input RMS current for Phase A
System Input RMS Current Phase B	The system input RMS current for Phase B
System Input RMS Current Phase C	The system input RMS current for Phase C
System On/Off Control	Turn system functionality on or off.
System Status	The operating status for the system
Top Fan Issue	The top fan is not operating within its normal parameters.
Unit Bottom Return Air Sensor Failure	Return air sensor at the bottom of the unit is disconnected or the signal is out of range.
Unit Bottom Return Sensor Humidity	Return humidity as measured by the sensor located at the bottom of the unit.
Unit Bottom Return Sensor Temperature	Return air temperature as measured by the sensor located at the bottom of the unit.

Table 3.50 Liebert® iCOM™ DCL—Glossary (continued)

Data Label	Data Description
Unit Bottom Supply Air Sensor Failure	Supply air sensor at the bottom of the unit is disconnected or the signal is out of range.
Unit Bottom Supply Sensor Temperature	Supply air temperature as measured by the sensor located at the bottom of the unit.
Unit Control Mode	Unit control mode.
Unit Middle First Supply Air Sensor Failure	First supply air sensor in the middle of the unit is disconnected or the signal is out of range.
Unit Middle First Supply Sensor Temperature	Supply air temperature as measured by the first sensor located in the middle of the unit.
Unit Middle Return Air Sensor Failure	Return air sensor in the middle of the unit is disconnected or the signal is out of range.
Unit Middle Return Sensor Humidity	Return humidity as measured by the sensor located in the middle of the unit.
Unit Middle Return Sensor Temperature	Return air temperature as measured by the sensor located in the middle of the unit.
Unit Middle Second Supply Air Sensor Failure	Second supply air sensor in the middle of the unit is disconnected or the signal is out of range.
Unit Middle Second Supply Sensor Temperature	Supply air temperature as measured by the second sensor located in the middle of the unit.
Unit Off	Unit was turned off.
Unit On	Unit was turned on.
Unit Operating State Reason	The reason the unit is in the current operating state.
Unit Operating State	Current operating state of the unit.
Unit Partial Shutdown	An event has occurred requiring some system components to be shutdown and disabled.
Unit Shutdown	An event has occurred requiring the unit to be shutdown and disabled to prevent damage to the system.
Unit Top Return Air Sensor Failure	Return air sensor at the top of the unit is disconnected or the signal is out of range.
Unit Top Return Sensor Humidity	Return humidity as measured by the sensor located at the top of the unit.
Unit Top Return Sensor Temperature	Return air temperature as measured by the sensor located at the top of the unit.
Unit Top Supply Air Sensor Failure	Supply air sensor at the top of the unit is disconnected or the signal is out of range.
Unit Top Supply Sensor Temperature	Supply air temperature as measured by the sensor located at the top of the unit.
Unspecified General Event	One or more unspecified events active. See local unit display for further details.
Water Leakage Detector	The water leakage detector sensor is disconnected or the signal is out of range.

Table 3.50 Liebert® iCOM™ DCL—Glossary (continued)

Data Label	Data Description
Sensor Issue	
Water Under Floor - Event Control	Enable/disable the activation of the [Water Under Floor] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Water Under Floor - Event Type	The event type for the [Water Under Floor] event.
Water Under Floor	Water under the floor is detected.

Table 3.53 Liebert® iCOM XDM - Glossary

Data Label	Data Description
Actual Air Temperature Set Point	The actual set point being used for air temperature control. This value may differ from [Air Temperature Set Point] if compensation is applied by the control.
Actual Auxiliary Air Temperature	Actual auxiliary air temperature value being used for control. This value may differ from the raw value received from the auxiliary device if filtering is applied.
Actual Humidity Set Point	The actual set point being used for humidity control. This value may differ from [Humidity Set Point] if compensation is applied by the control.
Adjusted Humidity	Humidity value being used for control. This value may differ from the actual measured [Return Humidity] based on several factors which may include, but are not limited to, selection of humidity control sensor and humidity control type.
Airflow Sensor Issue	Airflow sensor is disconnected or the signal is out of range.
Ambient Air Sensor Issue	Ambient air sensor is disconnected or the signal is out of range.
Analog Input Reading	Generic analog input reading (unitless).
ATS Load Not Powered Timeout	Automatic Transfer Switch Load not powered timeout
ATS Non Priority Load Breaker Timeout	Automatic Transfer Switch Non-priority load breaker timeout
ATS Switch Mode	ATS Switch Mode
Audit Log Record Counter	Number of audit log records that have been sent to the client.
Audit Log Update	Audit log has been updated.
Auto Restart Delay	If power is lost, the control will delay this amount of time after power is restored before restarting the unit.
Auto Restart Enable	Enable/disable automatic restart of unit after a power cycle.
Auto Tune License Expired	License for the AutoTune feature has expired.
Auto Tune License Expiring	License for the AutoTune feature has not been refreshed in 30 days and will be expiring soon.

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Automatic Transfer Switch - Active Power Supply	Indicates which power supply is in use by the Automatic Transfer Switch.
Automatic Transfer Switch - Power Supply 1 Status	Status of power supply 1 in Automatic Transfer Switch.
Automatic Transfer Switch - Power Supply 2 Status	Status of power supply 2 in Automatic Transfer Switch.
Aux Air Temp Device Communication Lost	Communication with external auxiliary device providing an air temperature value has been lost.
BMS Communications Timeout	Building Management System (or external monitoring system) has not communicated with the system within the expected timeframe.
BMS Timeout Period	Timeframe within which the Building Management System (or external monitoring system) must communicate with the system to avoid a timeout.
Calculated Next Maintenance Month	Calculated month of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Year].
Calculated Next Maintenance Year	Calculated year of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Month].
Chilled Water Control Valve Failure	Chilled water valve out of position. Chilled water control valve position does not match expected value.
Circuit Cooling Load	The amount of heat energy currently being removed by a single refrigeration circuit.
Clogged Air Filter - Event Control	Enable/disable the activation of the [Clogged Air Filter] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Clogged Air Filter - Event Type	The event type for the [Clogged Air Filter] event.
Clogged Air Filter	Air filter is dirty and needs to be (cleaned or) replaced.
Compressor Capacity Control State	Compressor capacity control state. When 'ON', the cooling capacity of the compressor has been reduced.
Compressor Capacity Reduced	Compressor capacity has been reduced.
Compressor Freeze Protection	Compressor has entered the freeze protection phase.
Compressor High Head Pressure - Event Control	Enable/disable the activation of the [Compressor High Head Pressure] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Compressor High Head Pressure - Event Type	The event type for the [Compressor High Head Pressure] event.
Compressor High Head Pressure	Compressor is shut down due to high head pressure.

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Compressor High Pressure Transducer Issue	Compressor high pressure transducer is disconnected or the signal is out of range.
Compressor Hours Exceeded	[Compressor Hours] has exceeded [Compressor Hours Threshold].
Compressor Hours Threshold	Threshold value used in the [Compressor Hours Exceeded] event.
Compressor Hours	Operating hours for compressor since last reset of this value.
Compressor Lockout	Enable/disable the use of the compressor.
Compressor Low Differential Pressure Lockout	Compressor exceeded maximum startup attempts due to low differential pressure. Compressor is shutdown and has been disabled.
Compressor Low Pressure Transducer Issue	Compressor low pressure transducer is disconnected or the signal is out of range.
Compressor Low Suction Pressure - Event Control	Enable/disable the activation of the [Compressor Low Suction Pressure] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Compressor Low Suction Pressure - Event Type	The event type for the [Compressor Low Suction Pressure] event.
Compressor Low Suction Pressure	Compressor is shut down due to low suction pressure.
Compressor Pump Down Issue - Event Control	Enable/disable the activation of the [Compressor Pump Down Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Compressor Pump Down Issue - Event Type	The event type for the [Compressor Pump Down Issue] event.
Compressor Pump Down Issue	Unable to pump down suction-side pressure during compressor shutdown.
Compressor Short Cycle - Event Control	Enable/disable the activation of the [Compressor Short Cycle] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Compressor Short Cycle - Event Type	The event type for the [Compressor Short Cycle] event.
Compressor Short Cycle	Compressor short cycle. A short cycle is defined as turning on and off a number of times over a set time period.
Compressor State	Compressor operational state.
Compressor Suction Pressure	Refrigerant pressure at the input of the compressor.
Compressor Superheat Over Threshold	Compressor discharge refrigerant superheat temperature has exceeded an upper threshold.

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Compressor Thermal Overload - Event Control	Enable/disable the activation of the [Compressor Thermal Overload] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Compressor Thermal Overload - Event Type	The event type for the [Compressor Thermal Overload] event.
Compressor Thermal Overload	Compressor is shut down due to thermal overload.
Condenser Circuit Unspecified General Event	One or more unspecified condenser circuit events active. See local unit display for further details.
Condenser Communication Lost	Communication with condenser unit has been lost.
Condenser Control Board Issue	The condenser control board is reporting an issue.
Condenser Fan Current	Condenser fan's measured input current.
Condenser Fan Issue	Condenser fan is not operating within its operational parameters.
Condenser Fan Power	Condenser fan's measured input power.
Condenser Fan Reversal Requested	Request the condenser fans to rotate in the reverse direction.
Condenser Fan Speed	Condenser fan speed expressed as a percentage of the maximum rated speed.
Condenser Issue - Event Control	Enable/disable the activation of the [Condenser Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Condenser Issue - Event Type	The event type for the [Condenser Issue] event.
Condenser Low Noise Mode - Full Days	Days of the week selected for low noise mode full day scheduling.
Condenser Low Noise Mode - Interval Days	Days of the week selected for low noise mode interval scheduling.
Condenser Low Noise Mode Max Fan Speed	Maximum fan speed when condenser is placed in low noise mode.
Condenser Low Noise Mode Schedule Control	Enable/disable scheduled control of condenser low noise mode.
Condenser Low Noise Mode Start Time	The time of day at which the condenser will transition into low noise mode.
Condenser Low Noise Mode State	State of condenser low noise mode scheduler control.
Condenser Low Noise Mode Stop Time	The time of day at which the condenser will transition out of low noise mode.

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Condenser Max Fan Speed Override	Fan speed exceeding the maximum set point in order to alleviate a high temperature or pressure condition.
Condenser Normal Mode Max Fan Speed	Maximum fan speed when condenser is not in low noise mode.
Condenser Outside Air Temp Out of Operating Range	[Condenser Outside Air Temperature] is either above an upper threshold or below a lower threshold.
Condenser Outside Air Temp Sensor Issue	Condenser outside air temperature sensor is disconnected or the signal is out of range.
Condenser Outside Air Temperature	Condenser ambient outside air temperature.
Condenser Refrigerant Pressure Over Threshold	Condenser refrigerant pressure has exceeded a threshold.
Condenser Refrigerant Pressure Sensor Issue	Condenser refrigerant pressure sensor is disconnected or the signal is out of range.
Condenser Refrigerant Pressure Under Threshold	Condenser refrigerant pressure has dropped below a threshold.
Condenser Refrigerant Pressure	Pressure of the refrigerant in a condenser circuit.
Condenser Refrigerant Type	Condenser refrigerant type.
Condenser Remote Shutdown	Condenser is shut down by a remote signal.
Condenser Supply Refrigerant Over Temp	Condenser supply refrigerant temperature has exceeded a threshold.
Condenser Supply Refrigerant Temp Sensor Issue	Condenser supply refrigerant temperature sensor is disconnected or the signal is out of range.
Condenser Supply Refrigerant Temperature	Temperature of the supply refrigerant in a condenser circuit.
Condenser Supply Refrigerant Under Temp	Condenser supply refrigerant temperature has dropped below a specified threshold.
Condenser TVSS Issue	The condenser Transient Voltage Surge Suppressor or Surge Protection Device has failed.
Condenser Unit Unspecified General Event	One or more unspecified condenser unit events active. See local unit display for further details.
Control Units Remote Shutdown Mismatch	The remote shutdown status of the master control unit does not match the remote shutdown status of the slave control unit.

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Control Units Unit Code Mismatch	Unit codes for the master and slave control units do not match.
Cooling Capacity	Cooling capacity in use, expressed as a percentage of the maximum rated capacity.
Cooling Capacity	Cooling capacity in use, expressed in kilowatts.
Cooling Control Temperature	Temperature value being used for cooling capacity control. This value is compared against the temperature set point to determine the amount of cooling to be applied.
Cooling State	Cooling operational state.
Customer Input 1 - Event Control	Enable/disable the activation of the [Customer Input 1] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 1 - Event Type	The event type for the [Customer Input 1] event.
Customer Input 1	Customer Input 1
Customer Input 2 - Event Control	Enable/disable the activation of the [Customer Input 2] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 2 - Event Type	The event type for the [Customer Input 2] event.
Customer Input 2	Customer Input 2
Customer Input 3 - Event Control	Enable/disable the activation of the [Customer Input 3] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 3 - Event Type	The event type for the [Customer Input 3] event.
Customer Input 3	Customer Input 3
Customer Input 4 - Event Control	Enable/disable the activation of the [Customer Input 4] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 4 - Event Type	The event type for the [Customer Input 4] event.
Customer Input 4	Customer Input 4
Dehumidifier State	Dehumidifier operational state.
Dehumidifier Utilization	Present dehumidifier utilization expressed as a percentage of the maximum rated capacity.
Dew Point Dead Band	Value that is divided evenly to form a range above and below [Dew Point Set Point]. If measured humidity is within this range, no humidification or dehumidification will occur. This parameter is used when [Humidity Control Type] is set to Dew Point.
Dew Point Max Adjust	Dew Point Margin Maximum Set Point Adjust
Dew Point Over Temp Threshold	Threshold value used in the [Dew Point Over Temperature] event.
Dew Point Over Temperature	Dew point temperature reading has exceeded the upper threshold.
Dew Point Proportional Band	Value that is divided evenly to form proportional humidity control bands above and below [Dew Point Set Point]. This parameter is used when [Humidity Control Type] is set to Dew Point.

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Dew Point Set Point	Desired dew point temperature.
Dew Point Under Temp Threshold	Threshold value used in the [Dew Point Under Temperature] event.
Dew Point Under Temperature	Dew point temperature reading has dropped below the lower threshold.
Dig Scroll Comp Discharge Over Temp - Event Ctrl	Enable/disable the activation of the [Dig Scroll Comp Discharge Over Temp] event.
Dig Scroll Comp Discharge Over Temp - Event Type	The event type for the [Dig Scroll Comp Discharge Over Temp] event.
Dig Scroll Comp Discharge Temp Sensor Issue	Digital scroll compressor discharge temperature sensor is disconnected or the signal is out of range.
Dig Scroll Comp Discharge Temp	Digital scroll compressor discharge temperature.
Dig Scroll Comp Over Temp	Digital scroll compressor is shut down due to head temperature exceeding an upper threshold.
Digital Output Board Not Detected	Digital output board is required to be connected, but no signal is detected.
Digital Scroll Compressor Loading	Present digital scroll compressor utilization expressed as a percentage of the maximum rated capacity.
Door Open	An open door was detected
EconoPhase Proportional Band Switchover	After entering EconoPhase mode, the threshold for continuing EconoPhase operation is gradually reduced to this percentage of [Air Temperature Proportional Band]. If the air temperature cannot be maintained within this reduced proportional band, the system will switch over to compressor control.
EEV Unspecified General Event	One or more unspecified electronic expansion valve events active. See local unit display for further details.
Electric Reheat State	Electric reheater operational state.
Energy Consumption	Energy consumption since the last reset of this value.
Event Log Record Counter	Number of event log records that have been sent to the client.
Expected Condenser Unit Count	Number of physical condenser units that are expected to be connected to the system.
Ext Air Damper Position Issue	Air damper position does not match expected value, as indicated by an external input signal.
Ext Air Sensor A Dew Point Temp	Dew point temperature as measured by external air sensor A.
Ext Air Sensor A Event Control	Enable/disable the activation of events related to measurements by the external air sensor A.

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Ext Air Sensor A High Humidity - Event Control	Enable/disable the activation of the [Ext Air Sensor A High Humidity] event. If set to 'disabled', the event will not be announced. This implies that the event will not be placed in any active event list or in any event history list.
Ext Air Sensor A High Humidity - Event Type	The event type for the [Ext Air Sensor A High Humidity] event.
Ext Air Sensor A High Humidity Threshold	Threshold value used in the [External Air Sensor A High Humidity] event.
Ext Air Sensor A High Humidity	[Ext Air Sensor A Humidity] has exceeded [Ext Air Sensor A High Humidity Threshold].
Ext Air Sensor A Humidity	Relative humidity as measured by external air sensor A.
Ext Air Sensor A Issue	The external air sensor A is disconnected or the signal is out of range.
Ext Air Sensor A Low Humidity - Event Control	Enable/disable the activation of the [Ext Air Sensor A Low Humidity] event. If set to 'disabled', the event will not be announced. This implies that the event will not be placed in any active event list or in any event history list.
Ext Air Sensor A Low Humidity - Event Type	The event type for the [Ext Air Sensor A Low Humidity] event.
Ext Air Sensor A Low Humidity Threshold	Threshold value used in the [External Air Sensor A Low Humidity] event.
Ext Air Sensor A Low Humidity	[Ext Air Sensor A Humidity] has dropped below [Ext Air Sensor A Low Humidity Threshold].
Ext Air Sensor A Over Temp - Event Control	Enable/disable the activation of the [External Air Sensor A Over Temperature] event. If set to 'disabled', the event will not be announced. This implies that the event will not be placed in any active event list or in any event history list.
Ext Air Sensor A Over Temp - Event Type	The event type for the [External Air Sensor A Over Temperature] event.
Ext Air Sensor A Over Temp Threshold	Threshold value used in the [External Air Sensor A Over Temperature] event.
Ext Air Sensor A Over Temperature	[Ext Air Sensor A Temperature] has exceeded [External Air Sensor A Over Temp Threshold].
Ext Air Sensor A Temperature	Air temperature as measured by external air sensor A.
Ext Air Sensor A Under Temp - Event Control	Enable/disable the activation of the [Ext Air Sensor A Under Temperature] event. If set to 'disabled', the event will not be announced. This implies that the event will not be placed in any active event list or in any event history list.
Ext Air Sensor A Under Temp - Event Type	The event type for the [Ext Air Sensor A Under Temperature] event.
Ext Air Sensor A Under Temp Threshold	Threshold value used in the [External Air Sensor A Under Temperature] event.
Ext Air Sensor A Under Temperature	[Ext Air Sensor A Temperature] has dropped below [Ext Air Sensor A Under Temp Threshold].
Ext Air Sensor B Humidity	Relative humidity as measured by external air sensor B.

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Ext Air Sensor B Temperature	Air temperature as measured by external air sensor B.
Ext Air Sensor C Humidity	Relative humidity as measured by external air sensor C.
Ext Air Sensor C Temperature	Air temperature as measured by external air sensor C.
Ext Compressor Lockout - Event Control	Enable/disable the activation of the [Ext Compressor Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Compressor Lockout - Event Type	The event type for the [Ext Compressor Lockout] event.
Ext Compressor Lockout	The compressor is shut down and disabled by an external input signal.
Ext Condenser Pump High Water - Event Control	Enable/disable the activation of the [Ext Condenser Pump High Water] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Condenser Pump High Water - Event Type	The event type for the [Ext Condenser Pump High Water] event.
Ext Dew Point Over Temp Threshold	Threshold value used in the [Ext Dew Point Over Temperature] event.
Ext Dew Point Over Temperature	At least one dew point temperature reading ([Ext Air Sensor A Dew Point Temp], [Ext Air Sensor B Dew Point Temp]...) has exceeded [Ext Dew Point Over Temp Threshold].
Ext Dew Point Under Temp Threshold	Threshold value used in the [Ext Dew Point Under Temperature] event.
Ext Dew Point Under Temperature	At least one dew point temperature reading ([Ext Air Sensor A Dew Point Temp], [Ext Air Sensor B Dew Point Temp]...) has dropped below [Ext Dew Point Under Temp Threshold].
Ext Free Cooling Lockout - Event Control	Enable/disable the activation of the [Ext Free Cooling Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Free Cooling Lockout - Event Type	The event type for the [Ext Free Cooling Lockout] event.
Ext Humidifier Lockout - Event Control	Enable/disable the activation of the [Ext Humidifier Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Humidifier Lockout - Event Type	The event type for the [Ext Humidifier Lockout] event.
Ext Loss of Air Blower - Event Control	Enable/disable the activation of the [Ext Loss of Air Blower] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Loss of Air Blower - Event Type	The event type for the [Ext Loss of Air Blower] event.
Ext Loss of Air Blower	Loss of air blower is detected, as indicated by an external input signal.

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Ext Loss of Flow - Event Control	Enable/disable the activation of the [Ext Loss of Flow] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Loss of Flow - Event Type	The event type for the [Ext Loss of Flow] event.
Ext Loss of Flow	Loss of flow is detected, as indicated by an external input signal.
Ext Over Temperature - Event Control	Enable/disable the activation of the [Ext Over Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Over Temperature - Event Type	The event type for the [Ext Over Temperature] event.
Ext Over Temperature	A temperature has exceeded its threshold, as indicated by an external input signal.
Ext Power Source A Failure	Unit main power source A failure, as indicated by an external input signal.
Ext Power Source B Failure	Unit main power source B failure, as indicated by an external input signal.
Ext Reheat Lockout - Event Control	Enable/disable the activation of the [Ext Reheat Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Reheat Lockout - Event Type	The event type for the [Ext Reheat Lockout] event.
Ext Standby Glycol Pump On - Event Control	Enable/disable the activation of the [Ext Standby Glycol Pump On] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Standby Glycol Pump On - Event Type	The event type for the [Ext Standby Glycol Pump On] event.
Ext Standby Glycol Pump On	The standby glycol pump is on, as indicated by an external input signal.
Ext Standby Unit On - Event Control	Enable/disable the activation of the [Ext Standby Unit On] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Standby Unit On - Event Type	The event type for the [Ext Standby Unit On] event.
Ext Standby Unit On	Standby unit is on, as indicated by an external input signal.
External Air Sensor B Issue	The external air sensor B is disconnected or the signal is out of range.
External Air Sensor C Issue	The external air sensor C is disconnected or the signal is out of range.
External Air Sensor D Issue	The external air sensor D is disconnected or the signal is out of range.
External Air Sensor E Issue	The external air sensor E is disconnected or the signal is out of range.
External Fire Detected	Fire detected, as indicated by an external input signal.

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Fan Hours Exceeded - Event Control	Enable/disable the activation of the [Fan Hours Exceeded] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Fan Hours Exceeded - Event Type	The event type for the [Fan Hours Exceeded] event.
Fan Speed Control Temperature	Temperature value being used for fan speed control. This value is compared against the fan speed temperature set point to determine the fan speed.
Fan Speed	Fan speed expressed as a percentage of the maximum rated speed.
Fan State	Fan operational state.
Flow Diff Prs Dead Band	Flow Diff Pressure Dead Band
Flow Manual Pump Speed	Flow Manual Pump Speed
Flow Rate	Fluid measured flow volume rate
Flow Sensor Failure	Fluid flow sensor failure
Fluid Control Type	Fluid flow algorithm control type
Fluid Dew Pnt Margin	Fluid Dew Point Margin Control Operation
Fluid Dewpoint Margin Control	Fluid Loop Dewpoint Margin Control is active
Fluid Diff Prs Control Integration Time	Fluid Diff Pressure Control Integration Time
Fluid Diff Prs Prop Band	Flow Diff Pressure Proportional Band
Fluid Diff Prs Set Point	Fluid Diff Pressure Set Point
Fluid Flow Blocked	Fluid Loop Flow Blocked (Loss of Flow with High Supply Pressure)
Fluid Flow Control Integration Time	Fluid Flow Control Integration Time
Fluid Flow Dead Band	Fluid Flow Dead Band; evenly split above/below set point
Fluid Flow High Supply Pressure	Fluid Loop Flow High Supply Pressure
Fluid Flow Low Inlet Pressure	Fluid Loop Flow Low Inlet Pressure
Fluid Flow Proportional Band	Fluid Flow Proportional Band; evenly split above/below set point
Fluid Flow Set Point	Fluid Flow Set Point
Fluid High Differential Pressure	Fluid Loop High Differential Pressure (Supply - Return)
Fluid Inlet Pressure Sensor Issue	Fluid Loop Inlet Pressure Sensor Issue

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Fluid Low Differential Pressure	Fluid Loop Low Differential Pressure (Supply - Return)
Fluid Low System Flow	Fluid Loop Low System Flow (Low total flow for units in group)
Fluid Return Pressure Sensor Issue	Fluid Loop Return Pressure Sensor Issue
Fluid Supply Pressure Sensor Issue	Fluid Loop Supply Pressure Sensor Issue
Fluid Temperature Control Integration Time	Time value used when system is under integral fluid temperature control.
Fluid Temperature Control Type	Type of algorithm used to control the system's output fluid temperature.
Fluid Temperature Dead Band	Value that is divided evenly to form a temperature range above and below [Fluid Temperature Set Point].
Fluid Temperature Proportional Band	Value that is divided evenly to form proportional temperature control.
Fluid Temperature Set Point	Desired chiller fluid temperature.
Force Networked Unit Rotation	If networked units are configured to rotate between standby and running, force the rotation to occur immediately.
Free Cooling State	Free cooling operational state.
Free Cooling Valve Open Position	Free cooling valve open position.
Group Independent Off	The group standby/cascade state for this unit has been overridden. The unit has been forced off.
Group Independent On	The group standby/cascade state for this unit has been overridden. The unit has been forced on.
Group Independent Operation Enable	Enable/disable group independent operation. If enabled, the user can override the unit's on/off state being controlled by its standby/cascade group.
Group Independent Operation	If this unit is part of a standby/cascade group, this value can be used to override the group control of the unit's on/off state.
High Power Shutdown - Event Control	Enable/disable the activation of the [High Power Shutdown] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
High Power Shutdown - Event Type	The event type for the [High Power Shutdown] event.
High Power Shutdown	Supply to high power components has been shutdown.
High Return Air Temperature Threshold	Threshold value used in the [Return Air Over Temperature] event.
High Return Humidity - Event Control	Enable/disable the activation of the [High Return Humidity] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
High Return Humidity - Event Type	The event type for the [High Return Humidity] event.
High Return Humidity Threshold	Threshold value used in the [High Return Humidity] event.
High Return Humidity	Return air high humidity event.
Hot Water / Hot Gas State	Hot water / hot gas operational state.
Hot Water / Hot Gas Valve Open Position	Hot water / hot gas valve open position.
Humidifier Issue - Event Control	Enable/disable the activation of the [Humidifier Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Humidifier Issue - Event Type	The event type for the [Humidifier Issue] event.
Humidifier State	Humidifier operational state.
Humidifier Utilization	Present humidifier utilization expressed as a percentage of the maximum rated capacity.
Humidity Control Integration Time	Time value used to add an integral term to humidity control. If set to 0, time will not be a factor in the control algorithm.
Humidity Control Sensor	Sensor from which humidity measurements will be used for humidification and dehumidification control.
Humidity Control Type	Type of algorithm to use for control of output humidity.
Humidity Dead Band	Value that is divided evenly to form a range above and below [Humidity Set Point]. If measured humidity is within this range, no humidification or dehumidification will occur.
Humidity Proportional Band	Value that is divided evenly to form proportional humidity control bands above and below [Humidity Set Point]. This setting applies to Relative, Predictive and Compensated [Humidity Control Type] selections.
Humidity Set Point	Desired relative humidity.
Input Undervoltage	One or more of the input phase voltages has dropped below the limit.
Instantaneous Power	Total electrical power currently being consumed.
Inverter Temperature	Inverter Temperature
Local Cooling Override	The local unit override status for cooling capacity.
Local Dehumidifier Override	The local unit override status for the dehumidifier.
Local Electric Heat Override	The local unit override status for electric heat.
Local Fan Override	The local unit override status for fan speed.
Local Humidifier Override	The local unit override status for the humidifier.
Loss of Air Flow	No air flow through the unit due to failure of all fans.

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Low Return Air Temperature Threshold	Threshold value used in the [Return Air Under Temperature] event.
Low Return Humidity - Event Control	Enable/disable the activation of the [Low Return Humidity] event. If set to 'disabled', the event will not be announced. This implies that the event will not be placed in any active event list or in any event history list.
Low Return Humidity - Event Type	The event type for the [Low Return Humidity] event.
Low Return Humidity Threshold	Threshold value used in the [Low Return Humidity] event.
Low Return Humidity	Return air low humidity event.
Main Fan Overload - Event Control	Enable/disable the activation of the [Main Fan Overload] event. If set to 'disabled', the event will not be announced. This implies that the event will not be placed in any active event list or in any event history list.
Main Fan Overload - Event Type	The event type for the [Main Fan Overload] event.
Maintenance Completed	Maintenance has been completed on the unit.
Maintenance Due	The calculated maintenance date has been reached.
Maintenance Ramp	The ratio of operations performed to the calculated operations available between maintenance intervals.
Maintenance Tracking State	Maintenance tracking operational state.
Master Unit Communication Lost - Event Control	Enable/disable the activation of the [Master Unit Communication Lost] event. If set to 'disabled', the event will not be announced. This implies that the event will not be placed in any active event list or in any event history list.
Master Unit Communication Lost - Event Type	The event type for the [Master Unit Communication Lost] event.
Master Unit Communication Lost	Communication with master unit has been lost.
Mixed Mode Lockout	Mixed mode has been entered too many times over a rolling time period and has been temporarily disabled. Mixed mode is defined as the use of a compressor on one refrigeration circuit and the use of a refrigerant pump on the other circuit.
Modbus Automatic Transfer Switch Communication Lost	Communications with Modbus Automatic Transfer Switch has been lost
Modbus Power Meter Communication Lost	Communication with Modbus power meter has been lost.
Networked Unit Daily Rotation Frequency	If [Networked Unit Rotation Frequency] is set to 'Daily', this sets the frequency of rotation within each day.
Networked Unit Rotation Count	If networked units are configured to rotate between standby and running, this is the number of units that will rotate at the selected rotation time.
Networked Unit Rotation Frequency	Configures the frequency with which networked units will rotate between a running state and a standby state.

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Networked Unit Rotation Time	If networked units are configured to rotate between standby and running, this is the time the rotation will occur on the day specified by [Networked Unit Rotation Frequency].
Outside Air Temperature	Ambient outside air temperature.
PHE Sup Tem Snsr Fail	Plate Heat Exchanger Supply Temperature Sensor Fail
Power Source: All status are okay	Automatic Transfer Switch Power Source: All status are okay
Power Source: Breaker command status closed	Automatic Transfer Switch Power Source: Breaker command status closed
Power Source: Breaker is closed	Automatic Transfer Switch Power Source: Breaker is closed
Power Source: Breaker Operating Hour Exceeded	Automatic Transfer Switch Power Source: Breaker operating hour exceeded
Power Source: Breaker Operation Count	Automatic Transfer Switch Power Source: Breaker Operation Count
Power Source: Breaker Timeout Issue	Automatic Transfer Switch Power Source: Breaker timeout issue
Power Source: Breaker withdrawn issue	Automatic Transfer Switch Power Source: Breaker withdrawn issue
Power Source: Frequency Is Too High	Automatic Transfer Switch Power Source: Frequency is too high
Power Source: Frequency Is Too Low	Automatic Transfer Switch Power Source: Frequency is too low
Power Source: L1-L2 voltage	Automatic Transfer Switch Power Source: L1-L2 voltage
Power Source: L2-L3 voltage	Automatic Transfer Switch Power Source: L2-L3 voltage
Power Source: L3-L1 voltage	Automatic Transfer Switch Power Source: L3-L1 voltage
Power Source: Line Frequency	Automatic Transfer Switch Power Source: Line Frequency
Power Source: Line Operating Hour Exceeded	Automatic Transfer Switch Power Source: Line operating hour exceeded
Power Source: Phase Sequence Issue	Automatic Transfer Switch Power Source: Phase sequence issue
Power Source: Voltage Is Too High	Automatic Transfer Switch Power Source: Voltage is too high

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Power Source: Voltage Is Too Low	Automatic Transfer Switch Power Source: Voltage is too low
Power Source: Voltage Phase Loss	Automatic Transfer Switch Power Source: Voltage phase loss
Power Source: Voltages Are Asymmetric	Automatic Transfer Switch Power Source: Voltages are asymmetric
PRE Operational Mode	Pumped Refrigerant Economizer operational mode.
Pump Drive Communications	Pump Drive Communications Status
Pump Drive Low AC Alarm	Pump Drive Low AC Alarm
Pump Drive Over Temperature	Pump Drive Over Temperature
Pump Drive Overload	Pump Drive Overload
Pump Drive Phase Loss Active	Pump Drive Phase Loss Active
Pump Drive Product Identification	Pump Drive Product Identification
Pump Drive Warning	Pump Drive Warning
Pump Flow Failure	Fluid pump flow failure
Pump Hours Threshold	Threshold value used in the [Pump Hours Exceeded] event.
Pump Hours	Operating hours for pump since last reset of this value.
Pump Inlet Refrigerant Temperature	Refrigerant temperature at the inlet of the pump.
Pump Inverter Failure	Fluid pump inverter failure
Pump Motor Amps	Pump Motor Amps
Pump Motor Power	Pump Motor Power
Pump Operating State	Fluid pump operating state
Pump Operating Without Flow	Fluid pump operation with no flow
Pump Operation Duration	Pump periodic operation duration
Pump Operation Period	Pump shall periodically operate if off for too long
Pump Operation Speed	Pump periodic operation speed
Pump Operation Type	Pump periodic operation type

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Pump Outlet Refrigerant Temperature	Refrigerant temperature at the outlet of the pump.
Pump Run Time	Fluid pump run time
Pump Speed	Fluid pump speed
Pump Speed	Pump speed expressed as a percentage of the maximum rated speed.
Pump Speed	Pump speed expressed as a percentage of the maximum rated speed.
Pump State	Pump operational state.
Pump Unspecified General Event	One or more unspecified pump events active. See local unit display for further details.
Quick Start Unit Cascade On Delay	When a Teamwork unit restarts after a power cycle, this value is used instead of [Unit Cascade On Delay]. The system will return to the use of [Unit Cascade On Delay] after a period of time determined by a predefined algorithm.
RAM Battery Issue	RAM or RAM backup battery is not operating correctly.
Raw Auxiliary Air Temperature	Air temperature value sent by an external auxiliary device, with no additional filtering by the receiving system. This may be an aggregated value from multiple sensors.
Reheat Utilization	Present reheating utilization expressed as a percentage of the maximum rated capacity.
Remote Sensor Average Over Temperature	[Remote Sensor Average Temperature] has exceeded [Remote Sensor Over Temp Threshold].
Remote Sensor Average Temperature	Average value of remote sensor temperature measurements.
Remote Sensor Average Under Temperature	[Remote Sensor Average Temperature] has dropped below [Remote Sensor Under Temp Threshold].
Remote Sensor Issue	Remote sensor is disconnected or the signal is out of range.
Remote Sensor Maximum Temperature	Maximum value of remote sensor temperature measurements.
Remote Sensor Over Temp Threshold	Threshold value used in the remote air sensor over temperature events.
Remote Sensor Over Temperature	[Remote Sensor Temperature] has exceeded [Remote Sensor Over Temp Threshold].
Remote Sensor System Average Over Temperature	[Remote Sensor System Average Temperature] has exceeded [Remote Sensor Over Temp Threshold].
Remote Sensor System Average Temperature	Average value of remote sensor temperature measurements among a group of interconnected units in a single system.
Remote Sensor System Average Under Temperature	[Remote Sensor System Average Temperature] has dropped below [Remote Sensor Under Temp Threshold].

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Remote Sensor System Maximum Temperature	Maximum value of remote sensor temperature measurements among a group of interconnected units in a single system.
Remote Sensor Temperature	Air temperature as measured by remote sensor.
Remote Sensor Under Temp Threshold	Threshold value used in the remote air sensor under temperature events.
Remote Sensor Under Temperature	[Remote Sensor Temperature] has dropped below [Remote Sensor Under Temp Threshold].
Return Air Over Temp - Event Control	Enable/disable the activation of the [Return Air Over Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Return Air Over Temp - Event Type	The event type for the [Return Air Over Temperature] event.
Return Air Over Temperature	Return air high temperature event.
Return Air Sensor Event Control	Enable/disable the activation of events related to measurements by the return air sensor.
Return Air Sensor Issue	The air sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Air Temperature	The temperature of the inlet air
Return Air Under Temp - Event Control	Enable/disable the activation of the [Return Air Under Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Return Air Under Temp - Event Type	The event type for the [Return Air Under Temperature] event.
Return Air Under Temperature	[Return Air Temperature] has dropped below [Low Return Air Temperature Threshold].
Return Dew Point	Dew point temperature measured at the inlet of the unit.
Return Fluid Low Temp	[Return Fluid Temperature] below Return Fluid Low Temp Threshold.
Return Fluid Over Temp Threshold	Threshold value used in the [Return Fluid Over Temp] event.
Return Fluid Over Temp	[Return Fluid Temperature] has exceeded a specified threshold.
Return Fluid Temp Sensor Issue	The return fluid temperature sensor is disconnected or the signal is out of range.
Return Fluid Temperature	Fluid temperature measured at the inlet of the unit.
Return Humidity Sensor Issue	The humidity sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Humidity	Relative humidity measured at the inlet of the unit.

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Return Sensor Events Initial Delay	Amount of time after the unit's evaporator fan has powered on before any return sensor events are detected and annunciated.
Slave Control Unit Communication Lost	The master control unit has lost Ethernet communications with the slave control unit.
Server Class	The general classification for this system
Service Required - Event Control	Enable/disable the activation of the [Service Required] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Service Required - Event Type	The event type for the [Service Required] event.
Service Required	Unit requires servicing.
Shutdown - Loss Of Power - Event Control	Enable/disable the activation of the [Shutdown - Loss Of Power] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Shutdown - Loss Of Power - Event Type	The event type for the [Shutdown - Loss Of Power] event.
Shutdown - Loss Of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power. This event remains active for 90 minutes.
Smoke Detected - Event Control	Enable/disable the activation of the [Smoke Detected] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Smoke Detected - Event Type	The event type for the [Smoke Detected] event.
Smoke Detected	Smoke detected.
Standby Units	The number of standby units.
Start Standby Units on High Temperature	Force the system to start all standby units if any unit in operation reports a high air temperature warning.
Supply Air Over/Under Temperature - Event Control	Enable/disable the activation of the [Supply Air Over Temperature] and [Supply Air Under Temperature] events.
Supply Air Temperature	Air temperature measured at the outlet of the unit.
Supply Chilled Water Over Temp	Chilled water temperature is too high, as indicated by an external input signal.
Supply Fluid Low Temp	[Supply Fluid Temperature] below Supply Fluid Low Temp Threshold.
Supply Fluid Over Temp Threshold	Threshold value used in the [Supply Fluid Over Temp] event.
Supply Fluid Over Temp	[Supply Fluid Temperature] has exceeded [Supply Fluid Over Temp Threshold].
Supply Fluid Temp Sensor Issue	The supply fluid temperature sensor is disconnected or the signal is out of range.

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Supply Fluid Temperature	Supply fluid temperature.
System Date and Time	The system date and time
System Dew Point	System aggregated dew point
System Event Acknowledge/Reset	Reset and/or acknowledge all events.
System Fluid Cooling Capacity	Chiller system-level cooling capacity in use, expressed in kilowatts.
System Fluid Diff Pressure	Chiller system-level fluid differential pressure
System Fluid Flow	Chiller system-level fluid measured flow volume rate
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Input RMS Current Phase A	The system input RMS current for Phase A
System Input RMS Current Phase B	The system input RMS current for Phase B
System Input RMS Current Phase C	The system input RMS current for Phase C
System On/Off Control	Turn system functionality on or off.
System Status	The operating status for the system
Tandem 'B' Compressor Hours	Operating hours for the 'B' compressor in a tandem configuration since last reset of this value.
Tandem 'B' Compressor State	Operational state for the 'B' compressor in a tandem configuration.
Teamwork Average Calculation Unit Count	If [Teamwork Temperature Calculation Method] is set to Average, this value specifies the maximum number of units in the Teamwork group used to calculate the average.
Teamwork Temperature Calculation Method	Method used for calculating the single Teamwork Mode air temperature from the temperature sensor values provided by the units in the Teamwork group. Each unit provides a single air temperature sensor value.
Temperature Control Sensor Issue	The air sensor selected for cooling control is disconnected or the signal is out of range.
Today's High Air Temperature Time	[Today's High Air Temperature] was measured at this time.

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Today's High Air Temperature	The highest external air temperature measured since midnight.
Today's High Humidity Time	[Today's High Humidity] was measured at this time
Today's High Humidity	The highest external humidity measured since midnight.
Today's Low Air Temperature Time	[Today's Low Air Temperature] was measured at this time.
Today's Low Air Temperature	The lowest external air temperature measured since midnight.
Today's Low Humidity Time	[Today's Low Humidity] was measured at this time
Today's Low Humidity	The lowest external humidity measured since midnight.
Unit Calculated Airflow	Total airflow calculated for the unit.
Unit Cascade Control Delay	When a Teamwork unit transitions from 'standby' to 'running' due to cascading, its local control operations are delayed for this amount of time. Control operations can include, but are not limited to, heating, cooling, humidification, and/or dehumidification.
Unit Cascade On Delay	If [Unit Cascade Type] is set to anything other than 'No', and the measured value has reached the transition threshold, a Teamwork unit in 'standby' will transition to 'running' after delaying this amount of time.
Unit Cascade Type	If a unit is a member of a Teamwork group, it can be configured to cascade, i.e. automatically transition between 'standby' and 'running'. The decision of when to perform the transition is determined by comparing the value of this parameter type against a given transition threshold.
Unit Code Missing	Unit code has not been entered and saved.
Unit Communication Lost	Master has lost communication with one or more networked units.
Unit Control Mode	Unit control mode.
Unit Cooling Load	The total amount of heat energy currently being removed by the unit.
Unit Dew Point	Unit aggregated dew point
Unit Fluid Cooling Capacity	Chiller unit-level cooling capacity in use, expressed in kilowatts.
Unit Fluid Diff Pressure	Chiller unit-level fluid differential pressure
Unit Fluid Flow	Chiller unit-level fluid measured flow volume rate
Unit Fluid Pump Speed	Chiller unit-level fluid pump speed
Unit Fluid Return Pressure	Chiller unit-level fluid return pressure
Unit Fluid Return Temperature	Chiller unit-level entering return fluid temperature
Unit Fluid Supply Pressure	Chiller unit-level fluid supply pressure
Unit Fluid Supply Temperature	Chiller unit-level leaving supply fluid temperature

Table 3.53 Liebert® iCOM XDM - Glossary (continued)

Data Label	Data Description
Unit In Standby Due To Cooling Loss	Unit forced into standby because it is unable to provide any cooling.
Unit Off Reason	The reason the unit is turned off.
Unit Off	Unit was turned off.
Unit On	Unit was turned on.
Unit Operating State	Current operating state of the unit.
Unit Partial Shutdown	An event has occurred requiring some system components to be shutdown and disabled.
Unit Shutdown	An event has occurred requiring the unit to be shutdown and disabled to prevent damage to the system.
Unit Standby	Unit was placed in standby mode.
Unspecified General Event	One or more unspecified events active. See local unit display for further details.
Virtual Master Enable	Enable/disable the virtual master feature.
Water Leakage Detector Sensor Issue	The water leakage detector sensor is disconnected or the signal is out of range.
Water Leakage	Water Leakage - Typically indicates unit internal water leakage
Water Under Floor - Event Control	Enable/disable the activation of the [Water Under Floor] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Water Under Floor - Event Type	The event type for the [Water Under Floor] event.
Water Under Floor	Water under the floor is detected.
XD Pump Communication Lost	Communications with XD Pump has been lost

Table 3.54 Liebert® MiniMate2 1-Ton to 5-Ton and 8-Ton—Input and Holding

Data Description	Input	Holding	# of Reg.	Scale	Access	Notes/Units

Table 3.57 Liebert® Mini-Mate3 – Glossary

Data Label	Data Description
(Deprecated) Free Cooling Status	(Deprecated) Free cooling status.
Actual Air Temperature Set Point	The actual set point being used for air temperature control. This value may differ from [Air Temperature Set Point] if compensation is applied by the control.
Actual Auxiliary Air Temperature	Actual auxiliary air temperature value being used for control. This value may differ from the raw value received from the auxiliary device if filtering is applied.
Actual Humidity Set Point	The actual set point being used for humidity control. This value may differ from [Humidity Set Point] if compensation is applied by the control.
Adjusted Humidity	Humidity value being used for control. This value may differ from the actual measured [Return Humidity] based on several factors which may include, but are not limited to, selection of humidity control sensor and humidity control type.
Air Economizer Availability	Indicates if the outside air conditions are appropriate for cooling with the air economizer or glycol freecooling.
Air Economizer Control Source	Source of control of the air economizer.
Air Economizer Emergency Override	Indoor room temperature has exceeded its upper threshold and the outdoor air damper has been opened for emergency cooling.
Air Economizer Reduced Airflow	Air economizer filter is dirty and needs to be cleaned or replaced.
Air Temperature Control Integration Time	Time value used when system is under integral air temperature control.
Air Temperature Control Sensor	Sensor from which air temperature measurements will be used for cooling and heating control.
Air Temperature Control Type	Type of algorithm used to control the system's output air temperature.
Air Temperature Dead Band	Value that is divided evenly to form a temperature range above and below [Air Temperature Set Point]. If measured air temperature is within this range, no heating or cooling will occur.
Air Temperature Proportional Band	Value that is divided evenly to form proportional temperature control bands above and below [Air Temperature Set Point].
Air Temperature Set Point	Desired air temperature. This set point is dependent upon which sensor is selected for control.
Airflow Sensor Issue	Airflow sensor is disconnected or the signal is out of range.
Ambient Air Sensor Issue	Ambient air sensor is disconnected or the signal is out of range.
Analog Input Reading	Generic analog input reading (unitless).
Auto Restart Delay	If power is lost, the control will delay this amount of time after power is restored before restarting the unit.
Aux Air Temp Device Communication Lost	Communication with external auxiliary device providing an air temperature value has been lost.
BMS Communications Timeout	Building Management System (or external monitoring system) has not communicated with the system within the expected timeframe.
BMS Timeout Period	Timeframe within which the Building Management System (or external monitoring system) must communicate with the system to avoid a timeout.

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
Calculated Next Maintenance Month	Calculated month of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Year].
Calculated Next Maintenance Year	Calculated year of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Month].
Chilled Water Control Valve Failure	Chilled water valve out of position. Chilled water control valve position does not match expected value.
Chilled Water Valve Hours	Operating hours for chilled water valve since last reset of this value.
Chilled Water Valve Operating Hours Threshold	Operating hours threshold for the chilled water valve. When the number of operating hours reaches this threshold, an event is generated.
Circuit Cooling Load	The amount of heat energy currently being removed by a single refrigeration circuit.
Clogged Air Filter - Event Control	Enable/disable the activation of the [Clogged Air Filter] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Clogged Air Filter - Event Type	The event type for the [Clogged Air Filter] event.
Clogged Air Filter	Air filter is dirty and needs to be (cleaned or) replaced.
Compressor Capacity Control State	Compressor capacity control state. When 'ON', the cooling capacity of the compressor has been reduced.
Compressor Capacity Reduced	Compressor capacity has been reduced.
Compressor High Head Pressure - Event Control	Enable/disable the activation of the [Compressor High Head Pressure] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Compressor High Head Pressure - Event Type	The event type for the [Compressor High Head Pressure] event.
Compressor High Head Pressure	Compressor is shut down due to high head pressure.
Compressor High Pressure Transducer Issue	Compressor high pressure transducer is disconnected or the signal is out of range.
Compressor Hours Exceeded	[Compressor Hours] has exceeded [Compressor Hours Threshold].
Compressor Hours Threshold	Threshold value used in the [Compressor Hours Exceeded] event.
Compressor Hours	Operating hours for compressor since last reset of this value.
Compressor Lockout	Enable/disable the use of the compressor.
Compressor Low Differential Pressure Lockout	Compressor exceeded maximum startup attempts due to low differential pressure. Compressor is shutdown and has been disabled.
Compressor Low Pressure Transducer Issue	Compressor low pressure transducer is disconnected or the signal is out of range.

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
Compressor Low Suction Pressure - Event Control	Enable/disable the activation of the [Compressor Low Suction Pressure] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Compressor Low Suction Pressure - Event Type	The event type for the [Compressor Low Suction Pressure] event.
Compressor Low Suction Pressure	Compressor is shut down due to low suction pressure.
Compressor Pump Down Issue - Event Control	Enable/disable the activation of the [Compressor Pump Down Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Compressor Pump Down Issue - Event Type	The event type for the [Compressor Pump Down Issue] event.
Compressor Pump Down Issue	Unable to pump down suction-side pressure during compressor shutdown.
Compressor Short Cycle - Event Control	Enable/disable the activation of the [Compressor Short Cycle] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Compressor Short Cycle - Event Type	The event type for the [Compressor Short Cycle] event.
Compressor Short Cycle	Compressor short cycle. A short cycle is defined as turning on and off a number of times over a set time period.
Compressor State	Compressor operational state.
Compressor Superheat Over Threshold	Compressor discharge refrigerant superheat temperature has exceeded an upper threshold.
Compressor Thermal Overload - Event Control	Enable/disable the activation of the [Compressor Thermal Overload] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Compressor Thermal Overload - Event Type	The event type for the [Compressor Thermal Overload] event.
Compressor Thermal Overload	Compressor is shut down due to thermal overload.
Condenser Circuit Unspecified General Event	One or more unspecified condenser circuit events active. See local unit display for further details.
Condenser Communication Lost	Communication with condenser unit has been lost.
Condenser Control Board Issue	The condenser control board is reporting an issue.
Condenser Fan Current	Condenser fan's measured input current.
Condenser Fan Issue	Condenser fan is not operating within its operational parameters.
Condenser Fan Power	Condenser fan's measured input power.
Condenser Fan Reversal Requested	Request the condenser fans to rotate in the reverse direction.
Condenser Fan Speed	Condenser fan speed expressed as a percentage of the maximum rated speed.

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
Condenser Issue - Event Control	Enable/disable the activation of the [Condenser Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Condenser Issue - Event Type	The event type for the [Condenser Issue] event.
Condenser Issue	Condenser is not operating within its operational parameters.
Condenser Low Noise Mode - Full Days	Days of the week selected for low noise mode full day scheduling.
Condenser Low Noise Mode - Interval Days	Days of the week selected for low noise mode interval scheduling.
Condenser Low Noise Mode Max Fan Speed	Maximum fan speed when condenser is placed in low noise mode.
Condenser Low Noise Mode Schedule Control	Enable/disable scheduled control of condenser low noise mode.
Condenser Low Noise Mode Start Time	The time of day at which the condenser will transition into low noise mode.
Condenser Low Noise Mode State	State of condenser low noise mode scheduler control.
Condenser Low Noise Mode Stop Time	The time of day at which the condenser will transition out of low noise mode.
Condenser Max Fan Speed Override	Fan speed exceeding the maximum set point in order to alleviate a high temperature or pressure condition.
Condenser Normal Mode Max Fan Speed	Maximum fan speed when condenser is not in low noise mode.
Condenser Outside Air Temp Out of Operating Range	[Condenser Outside Air Temperature] is either above an upper threshold or below a lower threshold.
Condenser Outside Air Temp Sensor Issue	Condenser outside air temperature sensor is disconnected or the signal is out of range.
Condenser Outside Air Temperature	Condenser ambient outside air temperature.
Condenser Refrigerant Pressure Over Threshold	Condenser refrigerant pressure has exceeded a threshold.
Condenser Refrigerant Pressure Sensor Issue	Condenser refrigerant pressure sensor is disconnected or the signal is out of range.
Condenser Refrigerant Pressure Under Threshold	Condenser refrigerant pressure has dropped below a threshold.
Condenser Refrigerant Pressure	Pressure of the refrigerant in a condenser circuit.
Condenser Refrigerant Type	Condenser refrigerant type.

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
Condenser Remote Shutdown	Condenser is shut down by a remote signal.
Condenser Supply Refrigerant Over Temp	Condenser supply refrigerant temperature has exceeded a threshold.
Condenser Supply Refrigerant Temp Sensor Issue	Condenser supply refrigerant temperature sensor is disconnected or the signal is out of range.
Condenser Supply Refrigerant Temperature	Temperature of the supply refrigerant in a condenser circuit.
Condenser Supply Refrigerant Under Temp	Condenser supply refrigerant temperature has dropped below a specified threshold.
Condenser TVSS Issue	The condenser Transient Voltage Surge Suppressor or Surge Protection Device has failed.
Condenser Unit Unspecified General Event	One or more unspecified condenser unit events active. See local unit display for further details.
Cooling Capacity	Cooling capacity in use, expressed as a percentage of the maximum rated capacity.
Cooling Control Temperature	Temperature value being used for cooling capacity control. This value is compared against the temperature set point to determine the amount of cooling to be applied.
Cooling State	Cooling operational state.
Customer Input 1 - Event Control	Enable/disable the activation of the [Customer Input 1] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 1 - Event Type	The event type for the [Customer Input 1] event.
Customer Input 1	Customer Input 1
Customer Input 2 - Event Control	Enable/disable the activation of the [Customer Input 2] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 2 - Event Type	The event type for the [Customer Input 2] event.
Customer Input 2	Customer Input 2
Customer Input 3 - Event Control	Enable/disable the activation of the [Customer Input 3] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 3 - Event Type	The event type for the [Customer Input 3] event.
Customer Input 3	Customer Input 3
Customer Input 4 - Event Control	Enable/disable the activation of the [Customer Input 4] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 4 - Event Type	The event type for the [Customer Input 4] event.
Customer Input 4	Customer Input 4

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
Dehumidifier Hours Exceeded	Operating hours for the dehumidifier have exceeded the threshold.
Dehumidifier Hours Threshold	Threshold value used in the [Dehumidifier Hours Exceeded] event.
Dehumidifier Hours	Operating hours for dehumidifier since last reset of this value.
Dehumidifier State	Dehumidifier operational state.
Dehumidifier Utilization	Present dehumidifier utilization expressed as a percentage of the maximum rated capacity.
Dew Point Dead Band	Value that is divided evenly to form a range above and below [Dew Point Set Point]. If measured humidity is within this range, no humidification or dehumidification will occur. This parameter is used when [Humidity Control Type] is set to Dew Point.
Dew Point Over Temperature	Dew point temperature reading has exceeded the upper threshold.
Dew Point Proportional Band	Value that is divided evenly to form proportional humidity control bands above and below [Dew Point Set Point]. This parameter is used when [Humidity Control Type] is set to Dew Point.
Dew Point Set Point	Desired dew point temperature.
Dew Point Under Temperature	Dew point temperature reading has dropped below the lower threshold.
Dig Scroll Comp Discharge Over Temp - Event Ctrl	Enable/disable the activation of the [Dig Scroll Comp Discharge Over Temp] event.
Dig Scroll Comp Discharge Over Temp - Event Type	The event type for the [Dig Scroll Comp Discharge Over Temp] event.
Dig Scroll Comp Discharge Temp Sensor Issue	Digital scroll compressor discharge temperature sensor is disconnected or the signal is out of range.
Dig Scroll Comp Discharge Temp	Digital scroll compressor discharge temperature.
Dig Scroll Comp Over Temp	Digital scroll compressor is shut down due to head temperature exceeding an upper threshold.
Digital Output Board Not Detected	Digital output board is required to be connected, but no signal is detected.
Digital Scroll Compressor Loading	Present digital scroll compressor utilization expressed as a percentage of the maximum rated capacity.
EEV Unspecified General Event	One or more unspecified electronic expansion valve events active. See local unit display for further details.
Electric Reheat State	Electric reheat operational state.
Electric Reheater Hours Exceeded	[Electric Reheater Hours] has exceeded [Electric Reheaters Hours Threshold].
Electric Reheater Hours Threshold	Threshold value used in the [Electric Reheater Hours Exceeded] event.

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
Electric Reheater Hours	Operating hours for electric reheater since last reset of this value.
Energy Consumption	Energy consumption since the last reset of this value.
Expected Condenser Unit Count	Number of physical condenser units that are expected to be connected to the system.
Ext Air Damper Position Issue	Air damper position does not match expected value, as indicated by an external input signal.
Ext Air Sensor A Dew Point Temp	Dew point temperature as measured by external air sensor A.
Ext Air Sensor A Event Control	Enable/disable the activation of events related to measurements by the external air sensor A.
Ext Air Sensor A High Humidity - Event Control	Enable/disable the activation of the [Ext Air Sensor A High Humidity] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Air Sensor A High Humidity - Event Type	The event type for the [Ext Air Sensor A High Humidity] event.
Ext Air Sensor A High Humidity Threshold	Threshold value used in the [External Air Sensor A High Humidity] event.
Ext Air Sensor A High Humidity	[Ext Air Sensor A Humidity] has exceeded [Ext Air Sensor A High Humidity Threshold].
Ext Air Sensor A Humidity	Relative humidity as measured by external air sensor A.
Ext Air Sensor A Issue	The external air sensor A is disconnected or the signal is out of range.
Ext Air Sensor A Low Humidity - Event Control	Enable/disable the activation of the [Ext Air Sensor A Low Humidity] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Air Sensor A Low Humidity - Event Type	The event type for the [Ext Air Sensor A Low Humidity] event.
Ext Air Sensor A Low Humidity Threshold	Threshold value used in the [External Air Sensor A Low Humidity] event.
Ext Air Sensor A Low Humidity	[Ext Air Sensor A Humidity] has dropped below [Ext Air Sensor A Low Humidity Threshold].
Ext Air Sensor A Over Temp - Event Control	Enable/disable the activation of the [External Air Sensor A Over Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Air Sensor A Over Temp - Event Type	The event type for the [External Air Sensor A Over Temperature] event.
Ext Air Sensor A Over Temp Threshold	Threshold value used in the [External Air Sensor A Over Temperature] event.
Ext Air Sensor A Over Temperature	[Ext Air Sensor A Temperature] has exceeded [External Air Sensor A Over Temp Threshold].
Ext Air Sensor A Temperature	Air temperature as measured by external air sensor A.
Ext Air Sensor A Under Temp - Event Control	Enable/disable the activation of the [Ext Air Sensor A Under Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
Ext Air Sensor A Under Temp - Event Type	The event type for the [Ext Air Sensor A Under Temperature] event.
Ext Air Sensor A Under Temp Threshold	Threshold value used in the [External Air Sensor A Under Temperature] event.
Ext Air Sensor A Under Temperature	[Ext Air Sensor A Temperature] has dropped below [Ext Air Sensor A Under Temp Threshold].
Ext Air Sensor B Humidity	Relative humidity as measured by external air sensor B.
Ext Air Sensor B Temperature	Air temperature as measured by external air sensor B.
Ext Air Sensor C Humidity	Relative humidity as measured by external air sensor C.
Ext Air Sensor C Temperature	Air temperature as measured by external air sensor C.
Ext Compressor Lockout - Event Control	Enable/disable the activation of the [Ext Compressor Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Compressor Lockout - Event Type	The event type for the [Ext Compressor Lockout] event.
Ext Compressor Lockout	The compressor is shut down and disabled by an external input signal.
Ext Condenser Pump High Water - Event Control	Enable/disable the activation of the [Ext Condenser Pump High Water] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Condenser Pump High Water - Event Type	The event type for the [Ext Condenser Pump High Water] event.
Ext Condenser Pump High Water	High water is detected in the condensate pump by the auxiliary float, as indicated by an external input signal.
Ext Dew Point Over Temp Threshold	Threshold value used in the [Ext Dew Point Over Temperature] event.
Ext Dew Point Over Temperature	At least one dew point temperature reading ([Ext Air Sensor A Dew Point Temp], [Ext Air Sensor B Dew Point Temp]...) has exceeded [Ext Dew Point Over Temp Threshold].
Ext Dew Point Under Temp Threshold	Threshold value used in the [Ext Dew Point Under Temperature] event.
Ext Dew Point Under Temperature	At least one dew point temperature reading ([Ext Air Sensor A Dew Point Temp], [Ext Air Sensor B Dew Point Temp]...) has dropped below [Ext Dew Point Under Temp Threshold].
Ext Free Cooling Lockout - Event Control	Enable/disable the activation of the [Ext Free Cooling Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Free Cooling Lockout - Event Type	The event type for the [Ext Free Cooling Lockout] event.
Ext Free Cooling Lockout	Free cooling is disabled by an external input signal.
Ext Humidifier Lockout - Event Control	Enable/disable the activation of the [Ext Humidifier Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Humidifier Lockout - Event Type	The event type for the [Ext Humidifier Lockout] event.

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
Ext Humidifier Lockout	The humidifier is shut down and disabled by an external input signal.
Ext Loss of Air Blower - Event Control	Enable/disable the activation of the [Ext Loss of Air Blower] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Loss of Air Blower - Event Type	The event type for the [Ext Loss of Air Blower] event.
Ext Loss of Air Blower	Loss of air blower is detected, as indicated by an external input signal.
Ext Loss of Flow - Event Control	Enable/disable the activation of the [Ext Loss of Flow] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Loss of Flow - Event Type	The event type for the [Ext Loss of Flow] event.
Ext Loss of Flow	Loss of flow is detected, as indicated by an external input signal.
Ext Over Temperature - Event Control	Enable/disable the activation of the [Ext Over Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Over Temperature - Event Type	The event type for the [Ext Over Temperature] event.
Ext Over Temperature	A temperature has exceeded its threshold, as indicated by an external input signal.
Ext Power Source A Failure	Unit main power source A failure, as indicated by an external input signal.
Ext Power Source B Failure	Unit main power source B failure, as indicated by an external input signal.
Ext Reheat Lockout - Event Control	Enable/disable the activation of the [Ext Reheat Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Reheat Lockout - Event Type	The event type for the [Ext Reheat Lockout] event.
Ext Reheat Lockout	The reheater is shut down and disabled by an external input signal.
Ext Standby Glycol Pump On - Event Control	Enable/disable the activation of the [Ext Standby Glycol Pump On] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Standby Glycol Pump On - Event Type	The event type for the [Ext Standby Glycol Pump On] event.
Ext Standby Glycol Pump On	The standby glycol pump is on, as indicated by an external input signal.
Ext Standby Unit On - Event Control	Enable/disable the activation of the [Ext Standby Unit On] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Standby Unit On - Event Type	The event type for the [Ext Standby Unit On] event.
Ext Standby Unit On	Standby unit is on, as indicated by an external input signal.
External Air Sensor B Issue	The external air sensor B is disconnected or the signal is out of range.

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
External Air Sensor C Issue	The external air sensor C is disconnected or the signal is out of range.
External Air Sensor D Issue	The external air sensor D is disconnected or the signal is out of range.
External Air Sensor E Issue	The external air sensor E is disconnected or the signal is out of range.
External Condenser TVSS Issue	The condenser Transient Voltage Surge Suppressor or Surge Protection Device has failed, as indicated by an external input signal.
External Condenser VFD Issue	The condenser fan Variable Frequency Drive is offline, as indicated by an external input signal.
External Fire Detected	Fire detected, as indicated by an external input signal.
Fan Control Sensor	Sensor to be used for fan speed control.
Fan Hours Exceeded - Event Control	Enable/disable the activation of the [Fan Hours Exceeded] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Fan Hours Exceeded - Event Type	The event type for the [Fan Hours Exceeded] event.
Fan Hours Exceeded	Operating hours for the unit blower fan have exceeded the threshold.
Fan Hours Threshold	Threshold value used in the [Fan Hours Exceeded] event.
Fan Hours	Operating hours for fan since last reset of this value.
Fan Issue	One or more fans are not operating within their operational parameters.
Fan Speed Control Temperature	Temperature value being used for fan speed control. This value is compared against the fan speed temperature set point to determine the fan speed.
Fan Speed Maximum Set Point	Maximum fan speed. This value may only be modified if iCOM is enabled to allow fan speed changes by the BMS.
Fan Speed Minimum Set Point	Minimum fan speed.
Fan Speed Temperature Set Point	If fan is in decoupled mode and not under manual control, the fan speed will vary depending on the delta between the selected fan control sensor temperature and this set point.
Fan Speed	Fan speed expressed as a percentage of the maximum rated speed.
Fan State	Fan operational state.
Fluid Flow Rate	Flow rate of fluid used for cooling.
Fluid Flow Sensor Issue	The fluid flow sensor is disconnected or the signal is out of range.
Fluid Input Temperature	Temperature of the fluid entering the cooling coil.
Fluid Output Temperature	Temperature of the fluid exiting the cooling coil.
Fluid Temperature Sensor Issue	The fluid temperature sensor is disconnected or the signal is out of range.
Free Cooling Fluid Temperature	Free cooling fluid temperature.

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
Free Cooling Internal Control Mode	Free cooling internal control mode
Free Cooling Internal Temperature Delta	Minimum temperature delta required between supply fluid and internal ambient air temperatures in order to enable free cooling.
Free Cooling State	Free cooling operational state.
Free Cooling Status	Free cooling status.
Free Cooling Temp Sensor Issue	The free cooling fluid temperature sensor is disconnected or the signal is out of range.
Free Cooling Valve Hours Exceeded	[Free Cooling Valve Hours] has exceeded [Free Cooling Valve Hours Threshold].
Free Cooling Valve Hours Threshold	Threshold value used in the [Free Cooling Valve Hours Exceeded] event.
Free Cooling Valve Hours	Operating hours for free cooling valve since last reset of this value.
Free Cooling Valve Open Position	Free cooling valve open position.
High Power Shutdown - Event Control	Enable/disable the activation of the [High Power Shutdown] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
High Power Shutdown - Event Type	The event type for the [High Power Shutdown] event.
High Power Shutdown	Supply to high power components has been shutdown.
High Return Air Temperature Threshold	Threshold value used in the [Return Air Over Temperature] event.
High Return Humidity - Event Control	Enable/disable the activation of the [High Return Humidity] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
High Return Humidity - Event Type	The event type for the [High Return Humidity] event.
High Return Humidity Threshold	Threshold value used in the [High Return Humidity] event.
High Return Humidity	Return air high humidity event.
High Static Pressure	High static pressure event.
High Supply Air Temperature Threshold	Threshold value used in the [Supply Air Over Temperature] event.
Hot Water / Hot Gas State	Hot water / hot gas operational state.
Hot Water / Hot Gas Valve Hours Exceeded	[Hot Water / Hot Gas Valve Hours] has exceeded [Hot Water / Hot Gas Valve Hours Threshold].
Hot Water / Hot Gas Valve Hours Threshold	Threshold value used in the [Hot Water / Hot Gas Valve Hours Exceeded] event.
Hot Water / Hot Gas Valve Hours	Operating hours for hot water / hot gas valve since last reset of this value.

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
Hot Water / Hot Gas Valve Open Position	Hot water / hot gas valve open position.
Humidifier Control Board Not Detected	Humidifier control board is required to be connected, but no signal is detected.
Humidifier Cylinder Worn	Humidifier cylinder is not operating properly and needs to be replaced.
Humidifier Hours Exceeded	Operating hours for the humidifier have exceeded the threshold.
Humidifier Hours Threshold	Threshold value used in the [Humidifier Hours Exceeded] event.
Humidifier Hours	Operating hours for humidifier since last reset of this value.
Humidifier Issue - Event Control	Enable/disable the activation of the [Humidifier Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Humidifier Issue - Event Type	The event type for the [Humidifier Issue] event.
Humidifier Issue	Humidifier issue detected, causing it to be locked out.
Humidifier Lockout	Enable/disable the use of the humidifier.
Humidifier Low Water	The water level in the humidifier has dropped below its threshold.
Humidifier Over Current	The electrical current to the humidifier has exceeded its upper threshold.
Humidifier State	Humidifier operational state.
Humidifier Under Current	The electrical current to the humidifier has dropped below its lower threshold.
Humidifier Utilization	Present humidifier utilization expressed as a percentage of the maximum rated capacity.
Humidity Control Integration Time	Time value used to add an integral term to humidity control. If set to 0, time will not be a factor in the control algorithm.
Humidity Control Sensor	Sensor from which humidity measurements will be used for humidification and dehumidification control.
Humidity Control Type	Type of algorithm to use for control of output humidity.
Humidity Dead Band	Value that is divided evenly to form a range above and below [Humidity Set Point]. If measured humidity is within this range, no humidification or dehumidification will occur.
Humidity Proportional Band	Value that is divided evenly to form proportional humidity control bands above and below [Humidity Set Point]. This setting applies to Relative, Predictive and Compensated [Humidity Control Type] selections.
Humidity Set Point	Desired relative humidity.
Infrared Humidifier Flush Rate	A multiple of an internal time constant that determines the flush duration of the infrared humidifier water pan.
Input Undervoltage	One or more of the input phase voltages has dropped below the limit.
Instantaneous Power	Total electrical power currently being consumed.
Local Cooling Override	The local unit override status for cooling capacity.
Local Dehumidifier Override	The local unit override status for the dehumidifier.

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
Local Electric Heat Override	The local unit override status for electric heat.
Local Fan Override	The local unit override status for fan speed.
Local Humidifier Override	The local unit override status for the humidifier.
Loss of Air Flow	No air flow through the unit due to failure of all fans.
Low Return Air Temperature Threshold	Threshold value used in the [Return Air Under Temperature] event.
Low Return Humidity - Event Control	Enable/disable the activation of the [Low Return Humidity] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Low Return Humidity - Event Type	The event type for the [Low Return Humidity] event.
Low Return Humidity Threshold	Threshold value used in the [Low Return Humidity] event.
Low Return Humidity	Return air low humidity event.
Low Static Pressure	Low static pressure event.
Low Supply Air Temperature Threshold	Threshold value used in the [Supply Air Under Temperature] event.
Main Chilled Water Valve	The master valve in a dual valve chilled water system.
Main Fan Overload - Event Control	Enable/disable the activation of the [Main Fan Overload] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Main Fan Overload - Event Type	The event type for the [Main Fan Overload] event.
Main Fan Overload	Main fan is shut down due to thermal overload.
Maintenance Completed	Maintenance has been completed on the unit.
Maintenance Due	The calculated maintenance date has been reached.
Maintenance Ramp	The ratio of operations performed to the calculated operations available between maintenance intervals.
Maintenance Tracking State	Maintenance tracking operational state.
Master Unit Communication Lost - Event Control	Enable/disable the activation of the [Master Unit Communication Lost] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Master Unit Communication Lost - Event Type	The event type for the [Master Unit Communication Lost] event.
Master Unit Communication Lost	Communication with master unit has been lost.
Minimum Chilled Water Temp Set Point Enable	Enable/disable the activation of [Minimum Chilled Water Temp Set Point].

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
Minimum Chilled Water Temp Set Point	Minimum desired chilled water temperature.
Mixed Mode Lockout	Mixed mode has been entered too many times over a rolling time period and has been temporarily disabled. Mixed mode is defined as the use of a compressor on one refrigeration circuit and the use of a refrigerant pump on the other circuit.
Modbus Power Meter Communication Lost	Communication with Modbus power meter has been lost.
Outside Air Temperature	Ambient outside air temperature.
PRE Operational Mode	Pumped Refrigerant Economizer operational mode.
Pump Hours Threshold	Threshold value used in the [Pump Hours Exceeded] event.
Pump Hours	Operating hours for pump since last reset of this value.
Pump Inlet Refrigerant Temperature	Refrigerant temperature at the inlet of the pump.
Pump Outlet Refrigerant Temperature	Refrigerant temperature at the outlet of the pump.
Pump Speed	Pump speed expressed as a percentage of the maximum rated speed.
Pump State	Pump operational state.
Pump Unspecified General Event	One or more unspecified pump events active. See local unit display for further details.
RAM Battery Issue	RAM or RAM backup battery is not operating correctly.
Raw Auxiliary Air Temperature	Air temperature value sent by an external auxiliary device, with no additional filtering by the receiving system. This may be an aggregated value from multiple sensors.
Reheat Utilization	Present reheating utilization expressed as a percentage of the maximum rated capacity.
Reheater Lockout	Enable/disable the use of the reheater.
Reheater Over Temperature	The temperature of the reheater has exceeded its threshold.
Remote Sensor Average Over Temperature	[Remote Sensor Average Temperature] has exceeded [Remote Sensor Over Temp Threshold].
Remote Sensor Average Temperature	Average value of remote sensor temperature measurements.
Remote Sensor Average Under Temperature	[Remote Sensor Average Temperature] has dropped below [Remote Sensor Under Temp Threshold].
Remote Sensor Issue	Remote sensor is disconnected or the signal is out of range.
Remote Sensor Maximum Temperature	Maximum value of remote sensor temperature measurements.
Remote Sensor Over Temp Threshold	Threshold value used in the remote air sensor over temperature events.
Remote Sensor Over Temperature	[Remote Sensor Temperature] has exceeded [Remote Sensor Over Temp Threshold].

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
Remote Sensor System Average Over Temperature	[Remote Sensor System Average Temperature] has exceeded [Remote Sensor Over Temp Threshold].
Remote Sensor System Average Temperature	Average value of remote sensor temperature measurements among a group of interconnected units in a single system.
Remote Sensor System Average Under Temperature	[Remote Sensor System Average Temperature] has dropped below [Remote Sensor Under Temp Threshold].
Remote Sensor System Maximum Temperature	Maximum value of remote sensor temperature measurements among a group of interconnected units in a single system.
Remote Sensor Temperature	Air temperature as measured by remote sensor.
Remote Sensor Under Temp Threshold	Threshold value used in the remote air sensor under temperature events.
Remote Sensor Under Temperature	[Remote Sensor Temperature] has dropped below [Remote Sensor Under Temp Threshold].
Return Air Over Temp - Event Control	Enable/disable the activation of the [Return Air Over Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Return Air Over Temp - Event Type	The event type for the [Return Air Over Temperature] event.
Return Air Over Temperature	Return air high temperature event.
Return Air Sensor Event Control	Enable/disable the activation of events related to measurements by the return air sensor.
Return Air Sensor Issue	The air sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Air Temperature	The temperature of the inlet air
Return Air Under Temp - Event Control	Enable/disable the activation of the [Return Air Under Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Return Air Under Temp - Event Type	The event type for the [Return Air Under Temperature] event.
Return Air Under Temperature	[Return Air Temperature] has dropped below [Low Return Air Temperature Threshold].
Return Dew Point	Dew point temperature measured at the inlet of the unit.
Return Humidity Sensor Issue	The humidity sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Humidity	Relative humidity measured at the inlet of the unit.
Server Class	The general classification for this system
Service Required - Event Control	Enable/disable the activation of the [Service Required] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
Service Required - Event Type	The event type for the [Service Required] event.
Service Required	Unit requires servicing.
Shutdown - Loss Of Power - Event Control	Enable/disable the activation of the [Shutdown - Loss Of Power] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Shutdown - Loss Of Power - Event Type	The event type for the [Shutdown - Loss Of Power] event.
Shutdown - Loss Of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power. This event remains active for 90 minutes.
Smoke Detected - Event Control	Enable/disable the activation of the [Smoke Detected] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Smoke Detected - Event Type	The event type for the [Smoke Detected] event.
Smoke Detected	Smoke detected.
Standby Units	The number of standby units.
Static Pressure Sensor Issue	The static pressure sensor is disconnected or the signal is out of range.
Static Pressure Sensor Out of Range	Static pressure sensor signal is out of its configured range.
Static Pressure Set Point	Desired static pressure.
Super Saver Call For Cooling	Call for cooling value used for Super Saver functionality. A higher call for cooling value indicates a need for a lower coolant temperature.
Supply Air Over Temperature	Supply air high temperature event.
Supply Air Over/Under Temperature - Event Control	Enable/disable the activation of the [Supply Air Over Temperature] and [Supply Air Under Temperature] events.
Supply Air Sensor Issue	The air sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Air Temperature	Air temperature measured at the outlet of the unit.
Supply Air Under Temperature	Supply air low temperature event.
Supply Chilled Water Loss of Flow	Supply chilled water or glycol flow is too low.
Supply Chilled Water Over Temp	Chilled water temperature is too high, as indicated by an external input signal.
Supply NTC Air Sensor Issue	The supply NTC air sensor is disconnected or the signal is out of range.
System Date and Time	The system date and time

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
System Event Acknowledge/Reset	Reset and/or acknowledge all events.
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Input RMS Current Phase A	The system input RMS current for Phase A
System Input RMS Current Phase B	The system input RMS current for Phase B
System Input RMS Current Phase C	The system input RMS current for Phase C
System On/Off Control	Turn system functionality on or off.
System Static Pressure	Static pressure measurement among a group of interconnected units in a single system.
System Status	The operating status for the system
Tandem 'B' Compressor Hours	Operating hours for the 'B' compressor in a tandem configuration since last reset of this value.
Tandem 'B' Compressor State	Operational state for the 'B' compressor in a tandem configuration.
Temperature Control Sensor Issue	The air sensor selected for cooling control is disconnected or the signal is out of range.
Thermal Control Override - Humidity Call	If [Thermal Control Override] is enabled, this value sets the percent call for humidification or dehumidification.
Thermal Control Override - Humidity Control Type	If [Thermal Control Override] is enabled, this value selects if the humidity override is applied to humidification or dehumidification.
Thermal Control Override - Temperature Call	If [Thermal Control Override] is enabled, this value sets the percent call for cooling or heating.
Thermal Control Override - Temperature Control Type	If [Thermal Control Override] is enabled, this value selects if the temperature override is applied to cooling or heating.
Thermal Control Override	Override internal programmatic control of thermal conditions. This includes, but may not be limited to, temperature and humidity. The ability to enable this override may require additional system configuration.
Today's High Air Temperature Time	[Today's High Air Temperature] was measured at this time.
Today's High Air Temperature	The highest external air temperature measured since midnight.

Table 3.57 Liebert® Mini-Mate3 – Glossary (continued)

Data Label	Data Description
Today's High Humidity Time	[Today's High Humidity] was measured at this time
Today's High Humidity	The highest external humidity measured since midnight.
Today's Low Air Temperature Time	[Today's Low Air Temperature] was measured at this time.
Today's Low Air Temperature	The lowest external air temperature measured since midnight.
Today's Low Humidity Time	[Today's Low Humidity] was measured at this time
Today's Low Humidity	The lowest external humidity measured since midnight.
Unit Calculated Airflow	Total airflow calculated for the unit.
Unit Code Missing	Unit code has not been entered and saved.
Unit Communication Lost	Master has lost communication with one or more networked units.
Unit Control Mode	Unit control mode.
Unit Cooling Load	The total amount of heat energy currently being removed by the unit.
Unit Off	Unit was turned off.
Unit On	Unit was turned on.
Unit Operating State Reason	The reason the unit is in the current operating state.
Unit Operating State	Current operating state of the unit.
Unit Partial Shutdown	An event has occurred requiring some system components to be shutdown and disabled.
Unit Shutdown	An event has occurred requiring the unit to be shutdown and disabled to prevent damage to the system.
Unit Standby	Unit was placed in standby mode.
Unit Static Pressure	Static pressure measurement for a single unit.
Unspecified General Event	One or more unspecified events active. See local unit display for further details.
Water Leakage Detector Sensor Issue	The water leakage detector sensor is disconnected or the signal is out of range.
Water Under Floor - Event Control	Enable/disable the activation of the [Water Under Floor] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Water Under Floor - Event Type	The event type for the [Water Under Floor] event.
Water Under Floor	Water under the floor is detected.

Table 3.60 Liebert® PEX4—Glossary

Data Label	Data Description
Air Filter Hours	Operating hours for the air filter since last reset of this value.
Average Relative Humidity	Average value of humidity sensor measurements.
Clogged Air Filter	Air filter is dirty and needs to be (cleaned or) replaced.
Compressor Control Mode	Compressor Control Mode
Compressor Discharge Superheat	Compressor discharge superheat value.
Compressor Discharge Temperature Sensor Failure	Compressor discharge temperature sensor is disconnected or the signal is out of range.
Compressor Discharge Temperature	Compressor discharge temperature value.

Table 3.60 Liebert® PEX4—Glossary (continued)

Data Label	Data Description
Compressor Driver Communication Failure Lockout	Compressor lockout occurred due to multiple communication failures with the compressor driver board.
Compressor Driver Communication Failure	A communication failure occurred with the compressor driver board.
Compressor Driver Failure Lockout	Compressor lockout occurred due to multiple failures of the compressor driver board.
Compressor Driver Failure	Compressor driver board failure detected.
Compressor High Pressure	Compressor high pressure detected.
Compressor Hours	Operating hours for compressor since last reset of this value.
Compressor Low Pressure	Compressor low pressure detected.
Compressor Pressure Difference Lockout	Compressor lockout occurred due to multiple compressor pressure differences.
Compressor Pressure Difference	Compressor pressure difference is out of range.
Compressor Suction Superheat	Compressor suction superheat value.
Compressor Suction Temperature Sensor Failure	Compressor suction temperature sensor is disconnected or the signal is out of range.
Compressor Suction Temperature	Compressor suction temperature value.
Cooling Capacity (Master)	Compressor utilization or chilled water valve position, based on unit type.
Cooling Proportional Band	Temperature control band above [Air Temperature Set Point]. If measured air temperature is within this band, cooling operations are proportionally controlled.
Cooling State	Cooling operational state.
Custom Alarm	Custom Alarm
Dehumidifier State	Dehumidifier operational state.
EEV Driver Communication Failure	A communication failure occurred with the EEV driver board.
EEV Driver Failure	EEV driver board failure detected.
Electric Reheat State	Electric reheater operational state.
Electric Reheater Hours	Operating hours for electric reheater since last reset of this value.
Electrical Heater Failure	The electric heater temperature exceeded a threshold.
Emergency Cooling	Emergency Cooling
Ext Condenser Pump High Water	High water is detected in the condensate pump by the auxiliary float, as indicated by an external input signal.
Ext Remote Shutdown	Unit is shut down by a remote signal.
External Air Sensor Issue	The external air sensor is disconnected or the signal is out of range.
External Fire Detected	Fire detected, as indicated by an external input signal.
External Humidity Sensor Issue	The external humidity sensor is disconnected or the signal is out of range.
Fan Control Mode	Fan Control Mode

Table 3.60 Liebert® PEX4—Glossary (continued)

Data Label	Data Description
Fan Hours	Operating hours for fan since last reset of this value.
Fan Issue	One or more fans are not operating within their operational parameters.
Fan Speed	Fan speed expressed as a percentage of the maximum rated speed.
Fan Static Pressure Sensor Failure	Fan static pressure sensor is disconnected or the signal is out of range.
Fan Static Pressure	Fan Static Pressure Measurement
Filter Maintenance Due	The operating hours of the filter has exceeded the threshold and needs to be maintained or replaced.
High Compressor Discharge Temperature Lockout	Compressor Lockout occurred due to high compressor discharge temperature.
High Compressor Discharge Temperature	Compressor discharge temperature has exceeded a threshold.
High Compressor Pressure Lockout	Compressor lockout occurred due to high compressor pressure.
High Compressor Pressure Abnormal	Compressor pressure has exceeded a normal threshold.
High Compressor Pressure Sensor Failure	High compressor pressure sensor is disconnected or the signal is out of range.
High Compressor Pressure	Compressor pressure has exceeded a threshold.
High Remote Air Humidity	Remote air humidity has exceeded a threshold.
High Return Humidity	[Return Humidity] has exceeded [High Return Humidity Threshold].
Humidification Proportional Band	Humidity control band below [Humidity Set Point]. If measured humidity is within this band, humidification operations are proportionally controlled.
Humidifier Hours	Operating hours for humidifier since last reset of this value.
Humidifier Issue	Humidifier issue detected, causing it to be locked out.
Humidifier State	Humidifier operational state.
Humidity Set Point	Desired relative humidity.
Input Frequency Deviation	The input frequency is outside of the normal range.
Input Overvoltage	One or more of the input phase voltages has exceeded the limit.
Input Undervoltage	One or more of the input phase voltages has dropped below the limit.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Loss of Airflow Sensor Failure	Airflow sensor is disconnected or the signal is out of range.
Loss of Airflow	Loss of airflow detected.
Loss of Teamwork Slave	Teamwork Slave is offline or not connected to the network
Low Compressor Discharge Superheat Lockout	Compressor lockout occurred due to low compressor discharge superheat temperature.
Low Compressor Discharge Superheat	Compressor discharge superheat has dropped below a threshold.
Low Compressor Pressure Abnormal	Compressor pressure has dropped below a normal threshold.

Table 3.60 Liebert® PEX4—Glossary (continued)

Data Label	Data Description
Low Compressor Pressure Lockout	Compressor lockout occurred due to low compressor pressure.
Low Compressor Pressure Sensor Failure	Low compressor pressure sensor is disconnected or the signal is out of range.
Low Compressor Pressure	Compressor pressure has dropped below a threshold.
Low Remote Air Humidity	Remote air humidity has dropped below a threshold.
Low Return Humidity	[Return Humidity] has dropped below [Low Return Humidity Threshold].
Monitoring ON/OFF	Monitoring ON/OFF
Power Loss Of Phase	One of the input phases has been lost.
Power Opposite Phase	The power input phases are incorrectly connected.
Relative Humidity	Relative Humidity measured at the humidity sensor
Remote Sensor Air Temperature Set Point	Desired temperature monitored by the remote air temperature sensors.
Remote Sensor Average Temperature	Average value of remote sensor temperature measurements.
Remote Sensor Over Temperature	[Remote Sensor Temperature] has exceeded [Remote Sensor Over Temp Threshold].
Remote Sensor Temperature	Air temperature as measured by remote sensor.
Remote Sensor Under Temperature	[Remote Sensor Temperature] has dropped below [Remote Sensor Under Temp Threshold].
Repeated Teamwork Address	The network address of two or more units in a teamwork are the same.
Return Air Over Temperature	Return air high temperature event.
Return Air Sensor Issue	The air sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Air Sensor Temperature	Air temperature measured at an inlet sensor.
Return Air Temperature Set Point	Desired air temperature at the inlet of the unit.
Return Air Temperature	The temperature of the inlet air
Return Air Under Temperature	[Return Air Temperature] has dropped below [Low Return Air Temperature Threshold].
Return Humidity Sensor Issue	The humidity sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Humidity	Relative humidity measured at the inlet of the unit.
Return Sensor Humidity	Relative humidity measured at an inlet sensor.
Shutdown - Loss Of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power.
Smoke Detected	Smoke detected.
Supply Air Over Temperature	[Supply Air Temperature] has exceeded [High Supply Air Temperature Threshold].
Supply Air Sensor Issue	The air sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Air Sensor Temperature	Air temperature measured at an outlet sensor.
Supply Air Temperature Set Point	Desired supply air temperature.
Supply Air Temperature	Air temperature measured at the outlet of the unit.

Table 3.60 Liebert® PEX4—Glossary (continued)

Data Label	Data Description
Supply Air Theoretical Humidity	This is a theoretical supply air humidity value which is calculated based on other values and is not a measurement directly from a humidity sensor.
Supply Air Under Temperature	Supply air low temperature event.
Supply Humidity Sensor Issue	The humidity sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Humidity	Relative humidity at the outlet of the unit.
Supply Sensor Humidity	Relative humidity measured at an outlet sensor.
System Input Frequency	The system input frequency
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Operating State	System Operating State
System Status	The operating status for the system
Teamwork Master is offline or not connected to the network	Loss of Teamwork Master
Teamwork Status	Teamwork Status
Water Under Floor	Water under the floor is detected.

Table 3.64 Liebert® XDC—Glossary

Data Label	Data Description
Auto Restart Delay	If power is lost, the control will delay this amount of time after power is restored before restarting the unit.
Calculated Next Maintenance Month	Calculated month of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Year].
Calculated Next Maintenance Year	Calculated year of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Month].
Circuit 1 Low Suction Pressure	Compressor circuit 1 low suction pressure.
Circuit 2 Low Suction Pressure	Compressor circuit 2 low suction pressure.
Cold Aisle Over Temp Threshold	Upper threshold value used in the [Cold Aisle Temp Out of Range] event.

Table 3.64 Liebert® XDC—Glossary (continued)

Data Label	Data Description
Cold Aisle Temp Out of Range	The air temperature in the cold aisle is either above [Cold Aisle Over Temp Threshold] or below [Cold Aisle Under Temp Threshold].
Cold Aisle Under Temp Threshold	Lower threshold value used in the [Cold Aisle Temp Out of Range] event.
Communication Status	Communication status of remote device.
Compressor 1A High Head Pressure	Compressor 1A high head pressure.
Compressor 1A Short Cycle	Compressor 1A short cycle. A short cycle is defined as turning on and off a number of times over a set time period.
Compressor 1A State	Compressor 1A operational state.
Compressor 1B High Head Pressure	Compressor 1B high head pressure.
Compressor 1B Short Cycle	Compressor 1B short cycle. A short cycle is defined as turning on and off a number of times over a set time period.
Compressor 1B State	Compressor 1B operational state.
Compressor 2A High Head Pressure	Compressor 2A high head pressure.
Compressor 2A Short Cycle	Compressor 2A short cycle. A short cycle is defined as turning on and off a number of times over a set time period.
Compressor 2A State	Compressor 2A operational state.
Compressor 2B High Head Pressure	Compressor 2B high head pressure.
Compressor 2B Short Cycle	Compressor 2B short cycle. A short cycle is defined as turning on and off a number of times over a set time period.
Compressor 2B State	Compressor 2B operational state.
Compressor Hours Exceeded	[Compressor Hours] has exceeded [Compressor Hours Threshold].
Compressor Pump Down Issue	Unable to pump down suction-side pressure during compressor shutdown.
Cooling Capacity	Cooling capacity in use, expressed as a percentage of the maximum rated capacity.
Cooling Capacity	Cooling capacity in use, expressed in kilowatts.
Customer Input 1	Customer input 1.
Dew Point Temperature	Dew point temperature, using the highest reading from all sensors.
Ext Air Over Temp Threshold	Threshold value used in the ([Ext Air Sensor A Over Temperature], [Ext Air Sensor B Over Temperature]...) events.
Ext Air Sensor A Dew Point Temp	Dew point temperature as measured by external air sensor A.
Ext Air Sensor A Humidity	Relative humidity as measured by external air sensor A.
Ext Air Sensor A Issue	The external air sensor A is disconnected or the signal is out of range.

Table 3.64 Liebert® XDC—Glossary (continued)

Data Label	Data Description
Ext Air Sensor A Over Temperature	[Ext Air Sensor A Temperature] has exceeded [Ext Air Over Temp Threshold].
Ext Air Sensor A Temperature	Air temperature as measured by external air sensor A.
Ext Air Sensor A Under Temperature	[Ext Air Sensor A Temperature] has dropped below [Ext Air Under Temp Threshold].
Ext Air Sensor B Dew Point Temp	Dew point temperature as measured by external air sensor B.
Ext Air Sensor B Humidity	Relative humidity as measured by external air sensor B.
Ext Air Sensor B Issue	The external air sensor B is disconnected or the signal is out of range.
Ext Air Sensor B Over Temperature	[Ext Air Sensor B Temperature] has exceeded [Ext Air Over Temp Threshold].
Ext Air Sensor B Temperature	Air temperature as measured by external air sensor B.
Ext Air Sensor B Under Temperature	[Ext Air Sensor B Temperature] has dropped below [Ext Air Under Temp Threshold].
Ext Air Under Temp Threshold	Threshold value used in the ([Ext Air Sensor A Under Temperature], [Ext Air Sensor B Under Temperature]...) events.
Ext Compressor Lockout	The compressor is shut down and disabled by an external input signal.
Ext Dew Point Over Temp Threshold	Threshold value used in the [Ext Dew Point Over Temperature] event.
Ext Dew Point Over Temperature	At least one dew point temperature reading ([Ext Air Sensor A Dew Point Temp], [Ext Air Sensor B Dew Point Temp]...) has exceeded [Ext Dew Point Over Temp Threshold].
Ext Fan Issue - Event Control	Enable/disable the activation of the [Ext Fan Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Fan Issue - Event Type	The event type for the [Ext Fan Issue] event.
Ext Fan Issue	One or more fans are not operating within their operational parameters.
Ext Remote Shutdown - Event Control	Enable/disable the activation of the [Remote Shutdown] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Remote Shutdown - Event Type	The event type for the [Remote Shutdown] event.
Ext Remote Shutdown	Unit is shut down by a remote signal.
Ext System Condensation Detected - Event Control	Enable/disable the activation of the [Ext System Condensation Detected] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext System Condensation Detected - Event Type	The event type for the [Ext System Condensation Detected] event.
Ext System Condensation Detected	External system condensation detected.
Fan Button Control	Enable or disable the buttons from controlling the state of the fans.

Table 3.64 Liebert® XDC—Glossary (continued)

Data Label	Data Description
Fan Economy Mode	Mode in which system slave fans are to be controlled.
Fan Issue	One or more fans are not operating within their operational parameters.
Fan On/Off Control	Turn system fans on or off.
Fan State	Current operational state of a group of fans.
Hot Aisle Over Temp Threshold	Upper threshold value used in the [Hot Aisle Temp Out of Range] event.
Hot Aisle Temp Out of Range	The air temperature in the Hot aisle is either above [Hot Aisle Over Temp Threshold] or below [Hot Aisle Under Temp Threshold].
Hot Aisle Under Temp Threshold	Lower threshold value used in the [Hot Aisle Temp Out of Range] event.
Hot Gas Solenoid Valve 1 Position	Hot gas solenoid valve 1 position.
Hot Gas Solenoid Valve 2 Position	Hot gas solenoid valve 2 position
Hot Gas Valve 1 Open Position	Hot gas valve 1 open position.
Hot Gas Valve 2 Open Position	Hot gas valve 2 open position.
Maintenance Completed	Maintenance has been completed on the unit.
Maintenance Due	The calculated maintenance date has been reached.
Maintenance Ramp	The ratio of operations performed to the calculated operations available between maintenance intervals.
Master Unit Communication Lost	Communication with master unit has been lost.
Minimum Room Temperature Set Point	Minimum desired room air temperature. If the room air temperature falls below this set point, the unit will reduce the cooling.
Master Fan Group State	Current operational state of the master fan group.
Pump 1 Loss of Flow	Loss of flow is detected in pump 1. The loss of flow condition occurs when no differential pressure is detected across the pump.
Pump 1 State	Pump 1 operational state.
Pump 2 Loss of Flow	Loss of flow is detected in pump 2. The loss of flow condition occurs when no differential pressure is detected across the pump.
Pump 2 State	Pump 2 operational state.
Pump Hours Exceeded	[Pump Hours] has exceeded [Pump Hours Threshold].
Pump Hours Threshold	Threshold value used in the [Pump Hours Exceeded] event.
Pump Hours	Operating hours for pump since last reset of this value.
Pump Short Cycle	Pumps have short cycled. A short cycle is defined as turning on and off a number of times over a set time period.
Pump Thermal Overload	Pump is shut down due to thermal overload.

Table 3.64 Liebert® XDC—Glossary (continued)

Data Label	Data Description
RAM Battery Issue	RAM or RAM backup battery is not operating correctly.
Remote Shutdown	Unit is shut down by a remote signal.
Sensor Issue - Event Control	Enable/disable the activation of the [Sensor Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Sensor Issue - Event Type	The event type for the [Sensor Issue] event.
Sensor Issue	One or more sensors are disconnected or the signals are out of range.
Sensor Temperature	Temperature as measured by sensor.
Service Required	Unit requires servicing.
Shutdown - Loss Of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power.
Smoke Detected	Smoke detected.
Supply Refrig Over Temp Threshold	Threshold value used in the [Supply Refrigerant Over Temp] event.
Supply Refrigerant Over Temp	Event that is activated when [Supply Refrigerant Temperature] exceeds [Supply Refrig Over Temp Threshold]. The event is deactivated when the temperature drops below the threshold.
Supply Refrigerant Temp Sensor Issue	The supply refrigerant temperature sensor is disconnected or the signal is out of range.
Supply Refrigerant Temperature	Supply refrigerant temperature.
Supply Refrigerant Under Temp	[Supply Refrigerant Temperature] has dropped below a specified threshold.
System Condensation Detected	System condensation detected.
System Date and Time	The system date and time
System Event Acknowledge/Reset	Reset and/or acknowledge all events.
System On/Off Control	Turn system functionality on or off.
System Status	The operating status for the system
Unit Code Missing	Unit code has not been entered and saved.
Unit Communication Lost	Master has lost communication with one or more networked units.
Unit Control Mode	Unit control mode.
Unit Off Reason	The reason the unit is turned off.
Unit Off	Unit was turned off.
Unit On	Unit was turned on.
Unit Operating State	Current operating state of the unit.
Unit Partial Shutdown	An event has occurred requiring some system components to be shutdown and disabled.
Unit Shutdown	An event has occurred requiring the unit to be shutdown and disabled to prevent damage to the system.

Table 3.64 Liebert® XDC—Glossary (continued)

Data Label	Data Description
Unit Standby	Unit was placed in standby mode.
Visual ID Control	Visual identification control to display an LED flashing sequence, allowing it to be visually located.
Water Under Floor	Water under the floor is detected.
XD Module Communication Lost	Communication with XD Module has been lost.

If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.

Reference Document: ST100I&C PA Parameters and Events, Version 18.0.

1. Any non-recognized alarm code by current firmware received from the Liebert® XDF control will trigger this event.

Table 3.69 Liebert® XDP—Glossary

Data Label	Data Description
Auto Restart Delay	If power is lost, the control will delay this amount of time after power is restored before restarting the unit.
Calculated Next Maintenance Month	Calculated month of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Year].
Calculated Next Maintenance Year	Calculated year of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Month].
Chilled Water Control Valve Failure	Chilled water valve out of position. Chilled water control valve position does not match expected value.
Chilled Water Valve Open Position	Chilled water valve open position.
Cold Aisle Over Temp Threshold	Upper threshold value used in the [Cold Aisle Temp Out of Range] event.
Cold Aisle Temp Out of Range	The air temperature in the cold aisle is either above [Cold Aisle Over Temp Threshold] or below [Cold Aisle Under Temp Threshold].
Cold Aisle Under Temp Threshold	Lower threshold value used in the [Cold Aisle Temp Out of Range] event.
Communication Status	Communication status of remote device.
Cooling Capacity	Cooling capacity in use, expressed as a percentage of the maximum rated capacity.
Cooling Capacity	Cooling capacity in use, expressed in kilowatts.
Customer Input 1	Customer input 1.

Table 3.69 Liebert® XDP—Glossary (continued)

Data Label	Data Description
Dew Point Temperature	Dew point temperature, using the highest reading from all sensors.
Ext Air Over Temp Threshold	Threshold value used in the ([Ext Air Sensor A Over Temperature], [Ext Air Sensor B Over Temperature]...) events.
Ext Air Sensor A Dew Point Temp	Dew point temperature as measured by external air sensor A.
Ext Air Sensor A Humidity	Relative humidity as measured by external air sensor A.
Ext Air Sensor A Issue	The external air sensor A is disconnected or the signal is out of range.
Ext Air Sensor A Over Temperature	[Ext Air Sensor A Temperature] has exceeded [Ext Air Over Temp Threshold].
Ext Air Sensor A Temperature	Air temperature as measured by external air sensor A.
Ext Air Sensor A Under Temperature	[Ext Air Sensor A Temperature] has dropped below [Ext Air Under Temp Threshold].
Ext Air Sensor B Dew Point Temp	Dew point temperature as measured by external air sensor B.
Ext Air Sensor B Humidity	Relative humidity as measured by external air sensor B.
Ext Air Sensor B Issue	The external air sensor B is disconnected or the signal is out of range.
Ext Air Sensor B Over Temperature	[Ext Air Sensor B Temperature] has exceeded [Ext Air Over Temp Threshold].
Ext Air Sensor B Temperature	Air temperature as measured by external air sensor B.
Ext Air Sensor B Under Temperature	[Ext Air Sensor B Temperature] has dropped below [Ext Air Under Temp Threshold].
Ext Air Under Temp Threshold	Threshold value used in the ([Ext Air Sensor A Under Temperature], [Ext Air Sensor B Under Temperature]...) events.
Ext Dew Point Over Temp Threshold	Threshold value used in the [Ext Dew Point Over Temperature] event.
Ext Dew Point Over Temperature	At least one dew point temperature reading ([Ext Air Sensor A Dew Point Temp], [Ext Air Sensor B Dew Point Temp]...) has exceeded [Ext Dew Point Over Temp Threshold].
Ext Fan Issue - Event Control	Enable/disable the activation of the [Ext Fan Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Fan Issue - Event Type	The event type for the [Ext Fan Issue] event.
Ext Fan Issue	One or more fans are not operating within their operational parameters.
Ext Remote Shutdown - Event Control	Enable/disable the activation of the [Remote Shutdown] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Remote Shutdown - Event Type	The event type for the [Remote Shutdown] event.
Ext Remote Shutdown	Unit is shut down by a remote signal.
Ext System Condensation Detected - Event Control	Enable/disable the activation of the [Ext System Condensation Detected] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext System Condensation Detected - Event Type	The event type for the [Ext System Condensation Detected] event.
Ext System Condensation Detected	External system condensation detected.

Table 3.69 Liebert® XDP—Glossary (continued)

Data Label	Data Description
Fan Button Control	Enable or disable the buttons from controlling the state of the fans.
Fan Economy Mode	Mode in which system slave fans are to be controlled.
Fan Issue	One or more fans are not operating within their operational parameters.
Fan On/Off Control	Turn system fans on or off.
Fan State	Current operational state of a group of fans.
High Supply Fluid Temperature Threshold	Threshold value used in the [Supply Chilled Water Over Temp] event.
Hot Aisle Over Temp Threshold	Upper threshold value used in the [Hot Aisle Temp Out of Range] event.
Hot Aisle Temp Out of Range	The air temperature in the Hot aisle is either above [Hot Aisle Over Temp Threshold] or below [Hot Aisle Under Temp Threshold].
Hot Aisle Under Temp Threshold	Lower threshold value used in the [Hot Aisle Temp Out of Range] event.
Maintenance Completed	Maintenance has been completed on the unit.
Maintenance Due	The calculated maintenance date has been reached.
Maintenance Ramp	The ratio of operations performed to the calculated operations available between maintenance intervals.
Master Unit Communication Lost	Communication with master unit has been lost.
Minimum Room Temperature Set Point	Minimum desired room air temperature. If the room air temperature falls below this set point, the unit will reduce the cooling.
Master Fan Group State	Current operational state of the master fan group.
Pump 1 Loss of Flow	Loss of flow is detected in pump 1. The loss of flow condition occurs when no differential pressure is detected across the pump.
Pump 1 State	Pump 1 operational state.
Pump 2 Loss of Flow	Loss of flow is detected in pump 2. The loss of flow condition occurs when no differential pressure is detected across the pump.
Pump 2 State	Pump 2 operational state.
Pump Hours Exceeded	[Pump Hours] has exceeded [Pump Hours Threshold].
Pump Hours Threshold	Threshold value used in the [Pump Hours Exceeded] event.
Pump Hours	Operating hours for pump since last reset of this value.
Pump Short Cycle	Pumps have short cycled. A short cycle is defined as turning on and off a number of times over a set time period.
Pump Thermal Overload	Pump is shut down due to thermal overload.
RAM Battery Issue	RAM or RAM backup battery is not operating correctly.
Remote Shutdown	Unit is shut down by a remote signal.
Sensor Issue - Event Control	Enable/disable the activation of the [Sensor Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Sensor Issue - Event Type	The event type for the [Sensor Issue] event.

Table 3.69 Liebert® XDP—Glossary (continued)

Data Label	Data Description
Sensor Issue	One or more sensors are disconnected or the signals are out of range.
Sensor Temperature	Temperature as measured by sensor.
Service Required	Unit requires servicing.
Shutdown - Loss Of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power.
Smoke Detected	Smoke detected.
Supply Chilled Water Over Temp	Chilled water temperature is too high, as indicated by an external input signal.
Supply Chilled Water Temp Sensor Issue	The supply chilled water temperature sensor is disconnected or the signal is out of range.
Supply Fluid Temperature	Supply chilled water or glycol temperature.
Supply Refrig Over Temp Threshold	Threshold value used in the [Supply Refrigerant Over Temp] event.
Supply Refrigerant Over Temp	Event that is activated when [Supply Refrigerant Temperature] exceeds [Supply Refrig Over Temp Threshold]. The event is deactivated when the temperature drops below the threshold.
Supply Refrigerant Temp Sensor Issue	The supply refrigerant temperature sensor is disconnected or the signal is out of range.
Supply Refrigerant Temperature	Supply refrigerant temperature.
Supply Refrigerant Under Temp	[Supply Refrigerant Temperature] has dropped below a specified threshold.
System Condensation Detected	System condensation detected.
System Date and Time	The system date and time
System Event Acknowledge/Reset	Reset and/or acknowledge all events.
System On/Off Control	Turn system functionality on or off.
System Status	The operating status for the system
Unit Code Missing	Unit code has not been entered and saved.
Unit Communication Lost	Master has lost communication with one or more networked units.
Unit Control Mode	Unit control mode.
Unit Off Reason	The reason the unit is turned off.
Unit Off	Unit was turned off.
Unit On	Unit was turned on.
Unit Operating State	Current operating state of the unit.
Unit Partial Shutdown	An event has occurred requiring some system components to be shutdown and disabled.
Unit Shutdown	An event has occurred requiring the unit to be shutdown and disabled to prevent damage to the system.
Unit Standby	Unit was placed in standby mode.
Visual ID Control	Visual identification control to display an LED flashing sequence, allowing it to be visually located.
Water Under Floor	Water under the floor is detected.
XD Module Communication Lost	Communication with XD Module has been lost.

Table 3.72 Vertiv™ Liebert® XDU - Glossary

Data Label	Data Description
Actual Air Temperature Set Point	The actual set point being used for air temperature control. This value may differ from [Air Temperature Set Point] if compensation is applied by the control.
Actual Auxiliary Air Temperature	Actual auxiliary air temperature value being used for control. This value may differ from the raw value received from the auxiliary device if filtering is applied.
Actual Humidity Set Point	The actual set point being used for humidity control. This value may differ from [Humidity Set Point] if compensation is applied by the control.
Adjusted Humidity	Humidity value being used for control. This value may differ from the actual measured [Return Humidity] based on several factors which may include, but are not limited to, selection of humidity control sensor and humidity control type.
Air Temperature Control Integration Time	Time value used when system is under integral air temperature control.
Air Temperature Control Sensor	Sensor from which air temperature measurements will be used for cooling and heating control.
Air Temperature Control Type	Type of algorithm used to control the system's output air temperature.
Air Temperature Dead Band	Value that is divided evenly to form a temperature range above and below [Air Temperature Set Point]. If measured air temperature is within this range, no heating or cooling will occur.
Air Temperature Proportional Band	Value that is divided evenly to form proportional temperature control bands above and below [Air Temperature Set Point].
Air Temperature Set Point	Desired air temperature. This set point is dependent upon which sensor is selected for control.
Airflow Sensor Issue	Airflow sensor is disconnected or the signal is out of range.
Ambient Air Sensor Issue	Ambient air sensor is disconnected or the signal is out of range.
Analog Input Reading	Generic analog input reading (unitless).
Audit Log Record Counter	Number of audit log records that have been sent to the client.

Table 3.72 Vertiv™Liebert® XDU - Glossary (continued)

Data Label	Data Description
Audit Log Update	Audit log has been updated.
Auto Restart Delay	If power is lost, the control will delay this amount of time after power is restored before restarting the unit.
Auto Restart Enable	Enable/disable automatic restart of unit after a power cycle.
Auto Tune License Expired	License for the AutoTune feature has expired.
Auto Tune License Expiring	License for the AutoTune feature has not been refreshed in 30 days and will be expiring soon.
Automatic Transfer Switch - Active Power Supply	Indicates which power supply is in use by the Automatic Transfer Switch.
Automatic Transfer Switch - Power Supply 1 Status	Status of power supply 1 in Automatic Transfer Switch.
Automatic Transfer Switch - Power Supply 2 Status	Status of power supply 2 in Automatic Transfer Switch.
Aux Air Temp Device Communication Lost	Communication with external auxiliary device providing an air temperature value has been lost.
BMS Communications Timeout	Building Management System (or external monitoring system) has not communicated with the system within the expected timeframe.
BMS Timeout Period	Timeframe within which the Building Management System (or external monitoring system) must communicate with the system to avoid a timeout.
Calculated Next Maintenance Month	Calculated month of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Year].
Calculated Next Maintenance Year	Calculated year of the next scheduled maintenance. Used in conjunction with [Calculated Next Maintenance Month].
Check Water System	Fluid check water system
Chilled Water Control Valve Failure	Chilled water valve out of position. Chilled water control valve position does not match expected value.
Circuit Cooling Load	The amount of heat energy currently being removed by a single refrigeration circuit.
Clogged Air Filter - Event Control	Enable/disable the activation of the [Clogged Air Filter] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Clogged Air Filter - Event Type	The event type for the [Clogged Air Filter] event.
Clogged Air Filter	Air filter is dirty and needs to be (cleaned or) replaced.
Communicate At Fan Power Off	Communicate with fans at power off
Condenser Issue	Condenser is not operating within its operational parameters.
Control Units Remote Shutdown Mismatch	The remote shutdown status of the master control unit does not match the remote shutdown status of the slave control unit.
Control Units Unit Code Mismatch	Unit codes for the master and slave control units do not match.
Cooling Capacity	Cooling capacity in use, expressed as a percentage of the maximum rated capacity.
Cooling Capacity	Cooling capacity in use, expressed in kilowatts.

Table 3.72 Vertiv™ Liebert® XDU - Glossary (continued)

Data Label	Data Description
Cooling Control Temperature	Temperature value being used for cooling capacity control. This value is compared against the temperature set point to determine the amount of cooling to be applied.
Cooling State	Cooling operational state.
Customer Input 1 - Event Control	Enable/disable the activation of the [Customer Input 1] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 1 - Event Type	The event type for the [Customer Input 1] event.
Customer Input 1	Customer Input 1
Customer Input 2 - Event Control	Enable/disable the activation of the [Customer Input 2] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 2 - Event Type	The event type for the [Customer Input 2] event.
Customer Input 2	Customer Input 2
Customer Input 3 - Event Control	Enable/disable the activation of the [Customer Input 3] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 3 - Event Type	The event type for the [Customer Input 3] event.
Customer Input 3	Customer Input 3
Customer Input 4 - Event Control	Enable/disable the activation of the [Customer Input 4] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Customer Input 4 - Event Type	The event type for the [Customer Input 4] event.
Customer Input 4	Customer Input 4
Dehumidifier State	Dehumidifier operational state.
Dehumidifier Utilization	Present dehumidifier utilization expressed as a percentage of the maximum rated capacity.
Dew Point Dead Band	Value that is divided evenly to form a range above and below [Dew Point Set Point]. If measured humidity is within this range, no humidification or dehumidification will occur. This parameter is used when [Humidity Control Type] is set to Dew Point.
Dew Point Over Temp Threshold	Threshold value used in the [Dew Point Over Temperature] event.
Dew Point Over Temperature	Dew point temperature reading has exceeded the upper threshold.
Dew Point Proportional Band	Value that is divided evenly to form proportional humidity control bands above and below [Dew Point Set Point]. This parameter is used when [Humidity Control Type] is set to Dew Point.
Dew Point Set Point	Desired dew point temperature.
Dew Point Under Temp Threshold	Threshold value used in the [Dew Point Under Temperature] event.
Dew Point Under Temperature	Dew point temperature reading has dropped below the lower threshold.
Digital Output Board Not Detected	Digital output board is required to be connected, but no signal is detected.

Table 3.72 Vertiv™Liebert® XDU - Glossary (continued)

Data Label	Data Description
Door Open	An open door was detected
Electric Reheat State	Electric reheater operational state.
Event Log Record Counter	Number of event log records that have been sent to the client.
Ext Air Damper Position Issue	Air damper position does not match expected value, as indicated by an external input signal.
Ext Air Sensor A Dew Point Temp	Dew point temperature as measured by external air sensor A.
Ext Air Sensor A Event Control	Enable/disable the activation of events related to measurements by the external air sensor A.
Ext Air Sensor A High Humidity - Event Control	Enable/disable the activation of the [Ext Air Sensor A High Humidity] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Air Sensor A High Humidity - Event Type	The event type for the [Ext Air Sensor A High Humidity] event.
Ext Air Sensor A High Humidity Threshold	Threshold value used in the [External Air Sensor A High Humidity] event.
Ext Air Sensor A High Humidity	[Ext Air Sensor A Humidity] has exceeded [Ext Air Sensor A High Humidity Threshold].
Ext Air Sensor A Humidity	Relative humidity as measured by external air sensor A.
Ext Air Sensor A Issue	The external air sensor A is disconnected or the signal is out of range.
Ext Air Sensor A Low Humidity - Event Control	Enable/disable the activation of the [Ext Air Sensor A Low Humidity] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Air Sensor A Low Humidity - Event Type	The event type for the [Ext Air Sensor A Low Humidity] event.
Ext Air Sensor A Low Humidity Threshold	Threshold value used in the [External Air Sensor A Low Humidity] event.
Ext Air Sensor A Low Humidity	[Ext Air Sensor A Humidity] has dropped below [Ext Air Sensor A Low Humidity Threshold].
Ext Air Sensor A Over Temp - Event Control	Enable/disable the activation of the [External Air Sensor A Over Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Air Sensor A Over Temp - Event Type	The event type for the [External Air Sensor A Over Temperature] event.
Ext Air Sensor A Over Temp Threshold	Threshold value used in the [External Air Sensor A Over Temperature] event.
Ext Air Sensor A Over Temperature	[Ext Air Sensor A Temperature] has exceeded [External Air Sensor A Over Temp Threshold].
Ext Air Sensor A Temperature	Air temperature as measured by external air sensor A.
Ext Air Sensor A Under Temp - Event Control	Enable/disable the activation of the [Ext Air Sensor A Under Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Air Sensor A Under Temp - Event Type	The event type for the [Ext Air Sensor A Under Temperature] event.
Ext Air Sensor A Under Temp Threshold	Threshold value used in the [External Air Sensor A Under Temperature] event.
Ext Air Sensor A Under Temperature	[Ext Air Sensor A Temperature] has dropped below [Ext Air Sensor A Under Temp Threshold].

Table 3.72 Vertiv™ Liebert® XDU - Glossary (continued)

Data Label	Data Description
Ext Air Sensor B Humidity	Relative humidity as measured by external air sensor B.
Ext Air Sensor B Temperature	Air temperature as measured by external air sensor B.
Ext Air Sensor C Humidity	Relative humidity as measured by external air sensor C.
Ext Air Sensor C Temperature	Air temperature as measured by external air sensor C.
Ext Compressor Lockout - Event Control	Enable/disable the activation of the [Ext Compressor Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Compressor Lockout - Event Type	The event type for the [Ext Compressor Lockout] event.
Ext Condenser Pump High Water - Event Control	Enable/disable the activation of the [Ext Condenser Pump High Water] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Condenser Pump High Water - Event Type	The event type for the [Ext Condenser Pump High Water] event.
Ext Condenser Pump High Water	High water is detected in the condensate pump by the auxiliary float, as indicated by an external input signal.
Ext Dew Point Over Temp Threshold	Threshold value used in the [Ext Dew Point Over Temperature] event.
Ext Dew Point Over Temperature	At least one dew point temperature reading ([Ext Air Sensor A Dew Point Temp], [Ext Air Sensor B Dew Point Temp]...) has exceeded [Ext Dew Point Over Temp Threshold].
Ext Dew Point Under Temp Threshold	Threshold value used in the [Ext Dew Point Under Temperature] event.
Ext Dew Point Under Temperature	At least one dew point temperature reading ([Ext Air Sensor A Dew Point Temp], [Ext Air Sensor B Dew Point Temp]...) has dropped below [Ext Dew Point Under Temp Threshold].
Ext Free Cooling Lockout - Event Control	Enable/disable the activation of the [Ext Free Cooling Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Free Cooling Lockout - Event Type	The event type for the [Ext Free Cooling Lockout] event.
Ext Humidifier Lockout - Event Control	Enable/disable the activation of the [Ext Humidifier Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Humidifier Lockout - Event Type	The event type for the [Ext Humidifier Lockout] event.
Ext Loss of Air Blower - Event Control	Enable/disable the activation of the [Ext Loss of Air Blower] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Loss of Air Blower - Event Type	The event type for the [Ext Loss of Air Blower] event.
Ext Loss of Air Blower	Loss of air blower is detected, as indicated by an external input signal.
Ext Loss of Flow - Event Control	Enable/disable the activation of the [Ext Loss of Flow] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Loss of Flow - Event Type	The event type for the [Ext Loss of Flow] event.
Ext Loss of Flow	Loss of flow is detected, as indicated by an external input signal.

Table 3.72 Vertiv™Liebert® XDU - Glossary (continued)

Data Label	Data Description
Ext Over Temperature - Event Control	Enable/disable the activation of the [Ext Over Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Over Temperature - Event Type	The event type for the [Ext Over Temperature] event.
Ext Over Temperature	A temperature has exceeded its threshold, as indicated by an external input signal.
Ext Power Source A Failure	Unit main power source A failure, as indicated by an external input signal.
Ext Power Source B Failure	Unit main power source B failure, as indicated by an external input signal.
Ext Reheat Lockout - Event Control	Enable/disable the activation of the [Ext Reheat Lockout] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Reheat Lockout - Event Type	The event type for the [Ext Reheat Lockout] event.
Ext Standby Glycol Pump On - Event Control	Enable/disable the activation of the [Ext Standby Glycol Pump On] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Standby Glycol Pump On - Event Type	The event type for the [Ext Standby Glycol Pump On] event.
Ext Standby Glycol Pump On	The standby glycol pump is on, as indicated by an external input signal.
Ext Standby Unit On - Event Control	Enable/disable the activation of the [Ext Standby Unit On] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Ext Standby Unit On - Event Type	The event type for the [Ext Standby Unit On] event.
Ext Standby Unit On	Standby unit is on, as indicated by an external input signal.
External Air Sensor B Issue	The external air sensor B is disconnected or the signal is out of range.
External Air Sensor C Issue	The external air sensor C is disconnected or the signal is out of range.
External Air Sensor D Issue	The external air sensor D is disconnected or the signal is out of range.
External Air Sensor E Issue	The external air sensor E is disconnected or the signal is out of range.
External Condenser TVSS Issue	The condenser Transient Voltage Surge Suppressor or Surge Protection Device has failed, as indicated by an external input signal.
External Condenser VFD Issue	The condenser fan Variable Frequency Drive is offline, as indicated by an external input signal.
External Fire Detected	Fire detected, as indicated by an external input signal.
Fan Back Draft Control Enable	Enable/disable fan back draft control.
Fan Back Draft Operation	Operational mode of the fan back draft control.
Fan Back Draft Speed Set Point	If [Fan Back Draft Control Enable] is enabled and unit is in standby, its evaporator fan will run at a fixed speed corresponding to this value.
Fan Control Sensor	Sensor to be used for fan speed control.
Fan Hours Exceeded - Event Control	Enable/disable the activation of the [Fan Hours Exceeded] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.

Table 3.72 Vertiv™ Liebert® XDU - Glossary (continued)

Data Label	Data Description
Fan Hours Exceeded - Event Type	The event type for the [Fan Hours Exceeded] event.
Fan Hours Exceeded	Operating hours for the unit blower fan have exceeded the threshold.
Fan Hours Threshold	Threshold value used in the [Fan Hours Exceeded] event.
Fan Hours	Operating hours for fan since last reset of this value.
Fan Issue	One or more fans are not operating within their operational parameters.
Fan Speed Control Temperature	Temperature value being used for fan speed control. This value is compared against the fan speed temperature set point to determine the fan speed.
Fan Speed Maximum Set Point	Maximum fan speed. This value may only be modified if iCOM is enabled to allow fan speed changes by the BMS.
Fan Speed Min Dehum	Minimum fan speed for dehumidification operation
Fan Speed Minimum Set Point	Minimum fan speed.
Fan Speed Temp Control Integration Time	Integration time value used when [Fan Speed Temperature Control Type] contains an integral term.
Fan Speed Temp Control Proportional Band	Value that is divided evenly to form proportional temperature control bands above and below [Fan Speed Temperature Set Point].
Fan Speed Temp Control Type	Type of algorithm used to control the fan speed when in decoupled mode. The algorithm is applied to the difference between the selected fan control sensor temperature and [Fan Speed Temperature Set Point].
Fan Speed Temperature Dead Band	Value that is divided evenly to form a temperature range above and below [Fan Speed Temperature Set Point]. If the fan control air temperature sensor is within this range, no changes to the fan speed will occur (unless overridden for internal safeguards).
Fan Speed Temperature Set Point	If fan is in decoupled mode and not under manual control, the fan speed will vary depending on the delta between the selected fan control sensor temperature and this set point.
Fan Speed	Fan speed expressed as a percentage of the maximum rated speed.
Fan State	Fan operational state.
Flow Dead Band	Fluid flow dead band
Flow Integration Time	Fluid flow integration time
Flow Proportional Band	Fluid flow proportional band
Flow Rate	Fluid measured flow volume rate
Flow Sensor Failure	Fluid flow sensor failure
Flow Set Point	Fluid flow rate set point
Force Networked Unit Rotation	If networked units are configured to rotate between standby and running, force the rotation to occur immediately.
Force Pump Rotate	Fluid force pump rotation (swap pump lead/lag operation)
Free Cooling State	Free cooling operational state.
Free Cooling Valve Open Position	Free cooling valve open position.

Table 3.72 Vertiv™Liebert® XDU - Glossary (continued)

Data Label	Data Description
FSA Control Input Issue	The analog input used to set the air temperature set point for fan speed control is disconnected or the signal is out of range.
Group Independent Off	The group standby/cascade state for this unit has been overridden. The unit has been forced off.
Group Independent On	The group standby/cascade state for this unit has been overridden. The unit has been forced on.
Group Independent Operation Enable	Enable/disable group independent operation. If enabled, the user can override the unit's on/off state being controlled by its standby/cascade group.
Group Independent Operation	If this unit is part of a standby/cascade group, this value can be used to override the group control of the unit's on/off state.
High Power Shutdown - Event Control	Enable/disable the activation of the [High Power Shutdown] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
High Power Shutdown - Event Type	The event type for the [High Power Shutdown] event.
High Power Shutdown	Supply to high power components has been shutdown.
High Return Air Temperature Threshold	Threshold value used in the [Return Air Over Temperature] event.
High Return Humidity - Event Control	Enable/disable the activation of the [High Return Humidity] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
High Return Humidity - Event Type	The event type for the [High Return Humidity] event.
High Return Humidity Threshold	Threshold value used in the [High Return Humidity] event.
High Return Humidity	Return air high humidity event.
High Supply Air Temperature Threshold	Threshold value used in the [Supply Air Over Temperature] event.
Hot Water / Hot Gas State	Hot water / hot gas operational state.
Hot Water / Hot Gas Valve Open Position	Hot water / hot gas valve open position.
Humidifier Issue - Event Control	Enable/disable the activation of the [Humidifier Issue] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Humidifier Issue - Event Type	The event type for the [Humidifier Issue] event.
Humidifier State	Humidifier operational state.
Humidifier Utilization	Present humidifier utilization expressed as a percentage of the maximum rated capacity.
Humidity Control Integration Time	Time value used to add an integral term to humidity control. If set to 0, time will not be a factor in the control algorithm.
Humidity Control Sensor	Sensor from which humidity measurements will be used for humidification and dehumidification control.
Humidity Control Type	Type of algorithm to use for control of output humidity.
Humidity Dead Band	Value that is divided evenly to form a range above and below [Humidity Set Point]. If measured humidity is within this range, no humidification or dehumidification will occur.

Table 3.72 Vertiv™ Liebert® XDU - Glossary (continued)

Data Label	Data Description
Humidity Proportional Band	Value that is divided evenly to form proportional humidity control bands above and below [Humidity Set Point]. This setting applies to Relative, Predictive and Compensated [Humidity Control Type] selections.
Humidity Set Point	Desired relative humidity.
Inverter Temperature	Inverter Temperature
Local Cooling Override	The local unit override status for cooling capacity.
Local Dehumidifier Override	The local unit override status for the dehumidifier.
Local Electric Heat Override	The local unit override status for electric heat.
Local Fan Override	The local unit override status for fan speed.
Local Humidifier Override	The local unit override status for the humidifier.
Loss of Air Flow	No air flow through the unit due to failure of all fans.
Low Return Air Temperature Threshold	Threshold value used in the [Return Air Under Temperature] event.
Low Return Humidity - Event Control	Enable/disable the activation of the [Low Return Humidity] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Low Return Humidity - Event Type	The event type for the [Low Return Humidity] event.
Low Return Humidity Threshold	Threshold value used in the [Low Return Humidity] event.
Low Return Humidity	Return air low humidity event.
Low Supply Air Temperature Threshold	Threshold value used in the [Supply Air Under Temperature] event.
Main Fan Overload - Event Control	Enable/disable the activation of the [Main Fan Overload] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Main Fan Overload - Event Type	The event type for the [Main Fan Overload] event.
Main Fan Overload	Main fan is shut down due to thermal overload.
Maintenance Completed	Maintenance has been completed on the unit.
Maintenance Due	The calculated maintenance date has been reached.
Maintenance Ramp	The ratio of operations performed to the calculated operations available between maintenance intervals.
Maintenance Tracking State	Maintenance tracking operational state.
Master Unit Communication Lost - Event Control	Enable/disable the activation of the [Master Unit Communication Lost] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Master Unit Communication Lost - Event Type	The event type for the [Master Unit Communication Lost] event.
Master Unit Communication Lost	Communication with master unit has been lost.
Mixed Mode Lockout	Mixed mode has been entered too many times over a rolling time period and has been temporarily disabled. Mixed mode is defined as the use of a compressor on one refrigeration circuit and the use of a refrigerant pump on the other circuit.

Table 3.72 Vertiv™Liebert® XDU - Glossary (continued)

Data Label	Data Description
Networked Unit Daily Rotation Frequency	If [Networked Unit Rotation Frequency] is set to 'Daily', this sets the frequency of rotation within each day.
Networked Unit Rotation Count	If networked units are configured to rotate between standby and running, this is the number of units that will rotate at the selected rotation time.
Networked Unit Rotation Frequency	Configures the frequency with which networked units will rotate between a running state and a standby state.
Networked Unit Rotation Time	If networked units are configured to rotate between standby and running, this is the time the rotation will occur on the day specified by [Networked Unit Rotation Frequency].
Outside Air Temperature	Ambient outside air temperature.
PHE Sup Tem Snsr Fail	Plate Heat Exchanger Supply Temperature Sensor Fail
Pump Drive Communications	Pump Drive Communications Status
Pump Drive Low AC Alarm	Pump Drive Low AC Alarm
Pump Drive Over Temperature	Pump Drive Over Temperature
Pump Drive Overload	Pump Drive Overload
Pump Drive Phase Loss Active	Pump Drive Phase Loss Active
Pump Drive Product Identification	Pump Drive Product Identification
Pump Drive Warning	Pump Drive Warning
Pump Expected Speed	Fluid pump expected speed for flow set point
Pump Flow Failure	Fluid pump flow failure
Pump Inverter Failure	Fluid pump inverter failure
Pump Motor Amps	Pump Motor Amps
Pump Motor Power	Pump Motor Power
Pump Operating State	Fluid pump operating state
Pump Operating Without Flow	Fluid pump operation with no flow
Pump Run Time	Fluid pump run time
Pump Speed	Fluid pump speed
Pump Speed	Pump speed expressed as a percentage of the maximum rated speed.
Quick Start Unit Cascade On Delay	When a Teamwork unit restarts after a power cycle, this value is used instead of [Unit Cascade On Delay]. The system will return to the use of [Unit Cascade On Delay] after a period of time determined by a predefined algorithm.
RAM Battery Issue	RAM or RAM backup battery is not operating correctly.
Raw Auxiliary Air Temperature	Air temperature value sent by an external auxiliary device, with no additional filtering by the receiving system. This may be an aggregated value from multiple sensors.
Reheat Utilization	Present reheating utilization expressed as a percentage of the maximum rated capacity.
Reset Pump Speed Calibration	Fluid reset pump speed calibration

Table 3.72 Vertiv™ Liebert® XDU - Glossary (continued)

Data Label	Data Description
Return Air Over Temp - Event Control	Enable/disable the activation of the [Return Air Over Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Return Air Over Temp - Event Type	The event type for the [Return Air Over Temperature] event.
Return Air Over Temperature	Return air high temperature event.
Return Air Sensor Event Control	Enable/disable the activation of events related to measurements by the return air sensor.
Return Air Sensor Issue	The air sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Air Temperature	The temperature of the inlet air
Return Air Under Temp - Event Control	Enable/disable the activation of the [Return Air Under Temperature] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Return Air Under Temp - Event Type	The event type for the [Return Air Under Temperature] event.
Return Air Under Temperature	[Return Air Temperature] has dropped below [Low Return Air Temperature Threshold].
Return Dew Point	Dew point temperature measured at the inlet of the unit.
Return Fluid Over Temp Threshold	Threshold value used in the [Return Fluid Over Temp] event.
Return Fluid Over Temp	[Return Fluid Temperature] has exceeded a specified threshold.
Return Fluid Temp Sensor Issue	The return fluid temperature sensor is disconnected or the signal is out of range.
Return Fluid Temperature	Fluid temperature measured at the inlet of the unit.
Return Humidity Sensor Issue	The humidity sensor at the inlet of the unit is disconnected or the signal is out of range.
Return Humidity	Relative humidity measured at the inlet of the unit.
Return Sensor Events Initial Delay	Amount of time after the unit's evaporator fan has powered on before any return sensor events are detected and annunciated.
Slave Control Unit Communication Lost	The master control unit has lost Ethernet communications with the slave control unit.
Server Class	The general classification for this system
Service Required - Event Control	Enable/disable the activation of the [Service Required] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Service Required - Event Type	The event type for the [Service Required] event.
Service Required	Unit requires servicing.
Shutdown - Loss Of Power - Event Control	Enable/disable the activation of the [Shutdown - Loss Of Power] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Shutdown - Loss Of Power - Event Type	The event type for the [Shutdown - Loss Of Power] event.
Shutdown - Loss Of Power	System lost power. This event becomes active when the unit is powered on following an unexpected loss of power. This event remains active for 90 minutes.

Table 3.72 Vertiv™Liebert® XDU - Glossary (continued)

Data Label	Data Description
Smoke Detected - Event Control	Enable/disable the activation of the [Smoke Detected] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Smoke Detected - Event Type	The event type for the [Smoke Detected] event.
Smoke Detected	Smoke detected.
Standby Units	The number of standby units.
Start Standby Units on High Temperature	Force the system to start all standby units if any unit in operation reports a high air temperature warning.
Supply Air Over Temperature	Supply air high temperature event.
Supply Air Over/Under Temperature - Event Control	Enable/disable the activation of the [Supply Air Over Temperature] and [Supply Air Under Temperature] events.
Supply Air Sensor Issue	The air sensor at the outlet of the unit is disconnected or the signal is out of range.
Supply Air Temperature	Air temperature measured at the outlet of the unit.
Supply Air Under Temperature	Supply air low temperature event.
Supply Chilled Water Over Temp	Chilled water temperature is too high, as indicated by an external input signal.
Supply Fan Emergency Op	Supply Fan Emergency Fan operate at communications disconnect
Supply Fluid Over Temp Threshold	Threshold value used in the [Supply Fluid Over Temp] event.
Supply Fluid Over Temp	[Supply Fluid Temperature] has exceeded [Supply Fluid Over Temp Threshold].
Supply Fluid Temp Sensor Issue	The supply fluid temperature sensor is disconnected or the signal is out of range.
Supply Fluid Temperature	Supply fluid temperature.
Supply NTC Air Sensor Issue	The supply NTC air sensor is disconnected or the signal is out of range.
Supply Sensor Events Initial Delay	Amount of time after the unit's evaporator fan has powered on before any supply sensor events are detected and annunciated.
System Date and Time	The system date and time
System Event Acknowledge/Reset	Reset and/or acknowledge all events.
System On/Off Control	Turn system functionality on or off.
System Status	The operating status for the system
Teamwork Average Calculation Unit Count	If [Teamwork Temperature Calculation Method] is set to Average, this value specifies the maximum number of units in the Teamwork group used to calculate the average.
Teamwork Mode	Teamwork mode. Provides the ability to group multiple networked units for the purpose of operating based on shared system parameters.
Teamwork Temperature Calculation Method	Method used for calculating the single Teamwork Mode air temperature from the temperature sensor values provided by the units in the Teamwork group. Each unit provides a single air temperature sensor value.
Temperature Control Sensor Issue	The air sensor selected for cooling control is disconnected or the signal is out of range.
Today's High Air Temperature Time	[Today's High Air Temperature] was measured at this time.

Table 3.72 Vertiv™ Liebert® XDU - Glossary (continued)

Data Label	Data Description
Today's High Air Temperature	The highest external air temperature measured since midnight.
Today's High Humidity Time	[Today's High Humidity] was measured at this time
Today's High Humidity	The highest external humidity measured since midnight.
Today's Low Air Temperature Time	[Today's Low Air Temperature] was measured at this time.
Today's Low Air Temperature	The lowest external air temperature measured since midnight.
Today's Low Humidity Time	[Today's Low Humidity] was measured at this time
Today's Low Humidity	The lowest external humidity measured since midnight.
TSA Control Input Issue	The analog input used to set the air temperature set point for cooling control is disconnected or the signal is out of range.
Unit Calculated Airflow	Total airflow calculated for the unit.
Unit Cascade Control Delay	When a Teamwork unit transitions from 'standby' to 'running' due to cascading, its local control operations are delayed for this amount of time. Control operations can include, but are not limited to, heating, cooling, humidification, and/or dehumidification.
Unit Cascade On Delay	If [Unit Cascade Type] is set to anything other than 'No', and the measured value has reached the transition threshold, a Teamwork unit in 'standby' will transition to 'running' after delaying this amount of time.
Unit Cascade Type	If a unit is a member of a Teamwork group, it can be configured to cascade, i.e. automatically transition between 'standby' and 'running'. The decision of when to perform the transition is determined by comparing the value of this parameter type against a given transition threshold.
Unit Code Missing	Unit code has not been entered and saved.
Unit Communication Lost	Master has lost communication with one or more networked units.
Unit Control Mode	Unit control mode.
Unit Cooling Load	The total amount of heat energy currently being removed by the unit.
Unit In Standby Due To Cooling Loss	Unit forced into standby because it is unable to provide any cooling.
Unit Off Reason	The reason the unit is turned off.
Unit Off	Unit was turned off.
Unit On	Unit was turned on.
Unit Operating State	Current operating state of the unit.
Unit Partial Shutdown	An event has occurred requiring some system components to be shutdown and disabled.
Unit Shutdown	An event has occurred requiring the unit to be shutdown and disabled to prevent damage to the system.
Unit Standby	Unit was placed in standby mode.
Unspecified General Event	One or more unspecified events active. See local unit display for further details.
Virtual Master Enable	Enable/disable the virtual master feature.

Table 3.72 Vertiv™Liebert® XDU - Glossary (continued)

Data Label	Data Description
Water Leakage Detector Sensor Issue	The water leakage detector sensor is disconnected or the signal is out of range.
Water Leakage	Water Leakage - Typically indicates unit internal water leakage
Water Under Floor - Event Control	Enable/disable the activation of the [Water Under Floor] event. If set to 'disabled', the event will not be annunciated. This implies that the event will not be placed in any active event list or in any event history list.
Water Under Floor - Event Type	The event type for the [Water Under Floor] event.
Water Under Floor	Water under the floor is detected.
XD Pump Communication Lost	Communications with XD Pump has been lost

If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.

Table 3.77 Liebert® EXC, Liebert® FDC, Liebert® FPC, Liebert® PPC, Liebert® RDC, Liebert® RX, Liebert® STS2/PDU—Glossary

Data Label	Data Description
Branch Current Phase 1	Branch breaker Phase 1 RMS current
Branch Current Phase 2	Branch Breaker Phase 2 RMS current
Branch Current Phase 3	Branch breaker Phase 3 RMS current
Branch Output Percent Load	Branch breaker percent load of rated current
Branch Output Power (W)	Branch breaker W
Branch Output Power Factor	Branch breaker Power Factor (real power/apparent power)
Branch Overcurrent	Branch breaker current has exceeded the limit.
Branch Undercurrent Warning	Branch breaker current is less than the limit.
Breaker position	Panelboard pole position of the branch breaker. First position if 2 or 3 pole breaker
Columns of Breakers	The breakers in this panel are physically arranged in this many columns.
Equipment Temperature Sensor Fail	Transformer temperature sensor has failed
Event State	Alarm present
Frequency Deviation	The output frequency is outside a specified range.
Ground Current	Unit Ground RMS current.
Ground Overcurrent	Unit ground current has exceeded the limit.
Input Voltage A-B	Unit Input RMS Voltage between Phase A and Phase B
Input Voltage B-C	Unit Input RMS Voltage between Phase B and Phase C
Input Voltage C-A	Unit Input RMS Voltage between Phase C and Phase A
Neutral Overcurrent	Unit neutral current has exceeded the limit.

**Table 3.77 Liebert® EXC, Liebert® FDC, Liebert® FPC, Liebert® PPC, Liebert® RDC, Liebert® RX, Liebert® STS2/PDU—
Glossary (continued)**

Data Label	Data Description
Number of Breakers	Number of Breakers in this panelboard.
Output Current Ix Crest Factor	Unit phase X Current Crest Factor (peak/RMS).
Output Current Ix K-Factor	Unit output Current Harmonic K-Factor for phase X.
Output Current Ix THD	Unit Current Total Harmonic Distortion for phase X.
Output Current Ix	Unit Phase X output RMS current.
Output Current Iy Crest Factor	Unit phase Y Current Crest Factor (peak/RMS).
Output Current Iy K-Factor	Unit output Current Harmonic K-Factor for phase Y.
Output Current Iy THD	Unit Current Total Harmonic Distortion for phase Y.
Output Current Iy	Unit Phase Y output RMS current.
Output Current Iz Crest Factor	Unit phase Z Current Crest Factor (peak/RMS).
Output Current Iz K-Factor	Unit output Current Harmonic K-Factor for phase Z.
Output Current Iz THD	Unit Current Total Harmonic Distortion for phase Z.
Output Current Iz	Unit Phase Z output RMS current.
Output Frequency	The system output frequency.
Output kW-Hrs	Branch Breaker accumulated KW-Hours since last KW-Hours reset.
Output kW-Hrs	Unit accumulated KW-Hours since last KW-Hours reset.
Output Neutral Current	Unit output Neutral RMS current.
Output Overcurrent	Unit phase current has exceeded the limit.
Output Overvoltage	Unit voltage has exceeded the limit.
Output Percent Load	Unit percent load of rated current
Output Power (kVA)	Unit output kVA
Output Power (kW)	Unit output KW
Output Power Factor	Unit output Power Factor (real power/apparent power)
Output Undervoltage	Unit voltage is less than the limit.
Output Voltage THD	Unit output Voltage Total Harmonic Distortion has exceeded the limit.
Output Voltage Vx THD	Unit Voltage Total Harmonic Distortion for phase X.
Output Voltage Vx	Unit output RMS voltage between phase X and Neutral
Output Voltage Vy THD	Unit Voltage Total Harmonic Distortion for phase Y.
Output Voltage Vy	Unit output RMS voltage between phase Y and Neutral
Output Voltage Vz THD	Unit Voltage Total Harmonic Distortion for phase Z.
Output Voltage Vz	Unit output RMS voltage between phase Z and Neutral

Glossary (continued)**

Data Label	Data Description
Output Voltage X-Y	Unit output RMS voltage between phases X and Y
Output Voltage Y-Z	Unit output RMS voltage between phases Y and Z.
Output Voltage Z-X	Unit output RMS voltage between phases Z and X.
Panel Ground Overcurrent	Panelboard Ground current has exceeded the limit.
Panel Main Current Ix Crest Factor	Panelboard phase X Current Crest Factor (peak/RMS).
Panel Main Current Ix THD	Current Total Harmonic Distortion for Panelboard phase X.
Panel Main Current Ix	Panelboard RMS current for phase X.
Panel Main Current Iy Crest Factor	Panelboard phase Y Current Crest Factor (peak/RMS).
Panel Main Current Iy THD	Current Total Harmonic Distortion for Panelboard phase Y.
Panel Main Current Iy	Panelboard RMS current for phase Y.
Panel Main Current Iz Crest Factor	Panelboard phase Z Current Crest Factor (peak/RMS).
Panel Main Current Iz THD	Current Total Harmonic Distortion for Panelboard phase Z.
Panel Main Current Iz	Panelboard RMS current for phase Z.
Panel Main Ground Current	Panelboard Ground RMS current.
Panel Main Neutral Current	Panelboard Neutral RMS current.
Panel Main Output kW-Hrs	Panelboard accumulated KW-Hours since last KW-Hours reset.
Panel Main Output Percent Load	Panelboard percent load of rated current
Panel Main Output Power (kVA)	Panelboard output kVA.
Panel Main Output Power (kW)	Panelboard output KW
Panel Main Output Power Factor	Panelboard Output Power Factor (real power/apparent power)
Panel Main Voltage Vx THD	Voltage Total Harmonic Distortion for Panelboard phase X.
Panel Main Voltage Vy THD	Voltage Total Harmonic Distortion for Panelboard phase Y.
Panel Main Voltage Vz THD	Voltage Total Harmonic Distortion for Panelboard phase Z.
Panel Main Voltage X-N	Panelboard RMS voltage between Phase X and Neutral.
Panel Main Voltage X-Y	Panelboard RMS voltage between phases X and Y.
Panel Main Voltage Y-N	Panelboard RMS voltage between Phase Y and Neutral.
Panel Main Voltage Y-Z	Panelboard RMS voltage between phases Y and Z.
Panel Main Voltage Z-N	Panelboard RMS voltage between Phase Z and Neutral.
Panel Main Voltage Z-X	Panelboard RMS voltage between phases Z and X.
Panel Neutral Overcurrent	Panelboard Neutral current has exceeded the limit.
Panel Overvoltage	Panelboard voltage has exceeded the limit.

**Table 3.77 Liebert® EXC, Liebert® FDC, Liebert® FPC, Liebert® PPC, Liebert® RDC, Liebert® RX, Liebert® STS2/PDU—
Glossary (continued)**

Data Label	Data Description
Panel Phase Overcurrent	Panelboard phase current has exceeded the limit.
Panel Summary Alarm	Panelboard Summary Alarm. Annunciates upon occurrence of any branch or panelboard main breaker alarm.
Panel Undervoltage	Panelboard voltage is less than the limit.
Phase Loss	Voltage and/or Frequency on one or more of the phases is outside the limit.
Phase Rotation Error	Unit input phase sequence is not A, B, C. The phase sequence should be verified and corrected.
Subfeed Current Ix Crest Factor	Subfeed breaker phase X Current Crest Factor (peak/RMS).
Subfeed Current Ix THD	Current Total Harmonic Distortion for Subfeed breaker phase X.
Subfeed Current Ix	Subfeed breaker RMS current for phase X.
Subfeed Current Iy Crest Factor	Subfeed breaker phase Y Current Crest Factor (peak/RMS).
Subfeed Current Iy THD	Current Total Harmonic Distortion for Subfeed breaker phase Y.
Subfeed Current Iy	Subfeed breaker RMS current for phase Y.
Subfeed Current Iz Crest Factor	Subfeed breaker phase Z Current Crest Factor (peak/RMS).
Subfeed Current Iz THD	Current Total Harmonic Distortion for Subfeed breaker phase Z.
Subfeed Current Iz	Subfeed breaker RMS current for phase Z.
Subfeed Ground Current	Subfeed breaker Ground RMS current.
Subfeed Ground Overcurrent	Subfeed breaker Ground current has exceeded the limit.
Subfeed Neutral Current	Subfeed breaker Neutral RMS current.
Subfeed Neutral Overcurrent	Subfeed breaker Neutral current has exceeded the limit.
Subfeed Output kW-Hrs	Subfeed breaker accumulated KW-Hours since last KW-Hours reset.
Subfeed Output Percent Load	Subfeed breaker percent load of rated current
Subfeed Output Power (kVA)	Subfeed breaker output kVA.
Subfeed Output Power (kW)	Subfeed breaker output KW
Subfeed Phase Overcurrent	Subfeed breaker phase current has exceeded the limit.
Subfeed Power Factor	Subfeed breaker Power Factor (real power/apparent power)
System Date and Time	Unit date and time
System Event Acknowledge/Reset	Alarm Present/Reset
System Shutdown - EPO	Unit shutdown by Emergency Power Off (EPO) switch
System Shutdown - REPO	Unit shutdown by Remote Emergency Power Off (REPO) switch
System Status	The operating status for the system
Transformer Overtemperature Power Off	Output power shutdown due to high transformer temperature
Transformer Overtemperature Shutdown	Unit shutdown due to transformer over temperature

Table 3.77 Liebert® EXC, Liebert® FDC, Liebert® FPC, Liebert® PPC, Liebert® RDC, Liebert® RX, Liebert® STS2/PDU—Glossary (continued)

Data Label	Data Description
Transformer Overtemperature	Transformer temperature has exceeded the limit
Transformer Overtemperature	Transformer temperature has exceeded the limit
Transformer Temperature Sensor Fail	Transformer temperature sensor has failed

Subfeed Current 3rd Harmonic Ph C	312712	—	1	10	Units : % Uint16
Subfeed Current 5th Harmonic Ph A	312713	—	1	10	Units : % Uint16
Subfeed Current 5th Harmonic Ph B	312714	—	1	10	Units : % Uint16
Subfeed Current 5th Harmonic Ph C	312715	—	1	10	Units : % Uint16
Subfeed Current 7th Harmonic Ph A	312716	—	1	10	Units : % Uint16
Subfeed Current 7th Harmonic Ph B	312717	—	1	10	Units : % Uint16
Subfeed Current 7th Harmonic Ph C	312718	—	1	10	Units : % Uint16
Subfeed Current 9th Harmonic Ph A	312719	—	1	10	Units : % Uint16
Subfeed Current 9th Harmonic Ph B	312720	—	1	10	Units : % Uint16
Subfeed Current 9th Harmonic Ph C	312721	—	1	10	Units : % Uint16
Subfeed Phase Overcurrent Warning Threshold	312722	—	1		Units : % Uint16
Subfeed Phase Overcurrent Alarm Threshold	312723	—	1		Units : % Uint16
Subfeed Neutral Overcurrent Threshold	312724	—	1		Uint16
Subfeed Ground Overcurrent Alarm Threshold	312725	—	1		Units : A AC

Table 3.85 Liebert® RXA and Liebert® TFX—Input Extended Range (Six-Digit Registers) (continued)

Data Label	Input	Holding	# of Reg	Scale	Notes/Units
					Uint16
Subfeed Highest Phase Peak Current	316154	—	2	1000	Units : A AC Uint32
Subfeed Neutral Overcurrent Warning Threshold	317379	—	1		Units : % Uint16
Subfeed Phase Overvoltage Alarm Threshold	317380	—	1		Units : % Uint16
Subfeed Phase Undervoltage Alarm Threshold	317381	—	1		Units : % Uint16
Subfeed Voltage (L-L) A-B	318478	—	1	10	Units : VAC Uint16
Subfeed Voltage (L-L) B-C	318479	—	1	10	Units : VAC Uint16
Subfeed Voltage (L-L) C-A	318480	—	1	10	Units : VAC Uint16
Subfeed Voltage (L-N) A-N	318481	—	1	10	Units : VAC Uint16
Subfeed Voltage (L-N) B-N	318482	—	1	10	Units : VAC Uint16
Subfeed Voltage (L-N) C-N	318483	—	1	10	Units : VAC Uint16
Subfeed Frequency	318484	—	1	10	Units : Hz Uint16

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary

Data Label	Description
Accessory Board Communication Fail	The accessory board(s) reported a communication failure
Apparent Power	The total apparent power of all phases
Apparent Power Load	The percentage of total apparent power of all phases to the rated capacity
Branch Current L1	The RMS current of L1 (1st pole) of the branch
Branch Current L2	The RMS current of L2 (2nd pole) of the branch
Branch Current L3	The RMS current of L3 (3rd pole) of the branch
Branch Current Neutral	The RMS current of the neutral of the branch
Branch Current Rating	The RMS current rating of the branch circuit breaker

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
Branch Energy	The total accumulated energy of the branch since the last reset
Branch Energy Reset	Set the total accumulated energy value of the branch to zero
Branch Highest Phase Current Load	The highest percentage of phase RMS current to the rated capacity of the branch
Branch Highest Phase Peak Current	The highest peak RMS current of all phases of the branch
Branch Low Current Alarm Threshold	The threshold for triggering a phase low current alarm of the branch
Branch Neutral Overcurrent Alarm Threshold	The threshold for triggering a neutral overcurrent alarm of the branch
Branch Neutral Overcurrent Warning Threshold	The threshold for triggering a neutral overcurrent warning of the branch
Branch Neutral Overcurrent	The neutral current crossed above the threshold of the branch
Branch Overcurrent Alarm Threshold	The threshold for triggering a phase overcurrent alarm of the branch
Branch Overcurrent Warning Threshold	The threshold for triggering a phase overcurrent warning of the branch
Branch Peak Current L1	The peak RMS current of L1 (1st pole) of the branch
Branch Peak Current L2	The peak RMS current of L2 (2nd pole) of the branch
Branch Peak Current L3	The peak RMS current of L3 (3rd pole) of the branch
Branch Peak Current Reset	Set the peak current value of the branch to zero
Branch Peak Demand	The peak demand of all phases of the branch
Branch Peak Demand Reset	Set the peak demand value of the branch to zero
Branch Phase Overcurrent	The phase current crossed above the threshold of the branch
Branch Phase Undercurrent	The phase current crossed below the threshold of the branch
Branch Position	The pole position of the branch circuit breaker within the panelboard, lowest pole if two or three pole circuit breaker
Branch Power Factor	The ratio of real to apparent power for the sum of all phases for the branch
Branch Real Power	The total real (active) power of all phases of the branch
Current 3rd Harmonic Ph A	The percentage of the 3rd harmonic present in phase A current with respect to the fundamental frequency
Current 3rd Harmonic Ph B	The percentage of the 3rd harmonic present in phase B current with respect to the fundamental frequency
Current 3rd Harmonic Ph C	The percentage of the 3rd harmonic present in phase C current with respect to the fundamental frequency
Current 5th Harmonic Ph A	The percentage of the 5th harmonic present in phase A current with respect to the fundamental frequency
Current 5th Harmonic Ph B	The percentage of the 5th harmonic present in phase B current with respect to the fundamental frequency
Current 5th Harmonic Ph C	The percentage of the 5th harmonic present in phase C current with respect to the fundamental frequency
Current 7th Harmonic Ph A	The percentage of the 7th harmonic present in phase A current with respect to the fundamental frequency
Current 7th Harmonic Ph B	The percentage of the 7th harmonic present in phase B current with respect to the fundamental frequency
Current 7th Harmonic Ph C	The percentage of the 7th harmonic present in phase C current with respect to the fundamental frequency
Current 9th Harmonic Ph A	The percentage of the 9th harmonic present in phase A current with respect to the fundamental frequency

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
Current 9th Harmonic Ph B	The percentage of the 9th harmonic present in phase B current with respect to the fundamental frequency
Current 9th Harmonic Ph C	The percentage of the 9th harmonic present in phase C current with respect to the fundamental frequency
Current Crest Factor Ph A	The ratio of phase A peak to RMS current
Current Crest Factor Ph B	The ratio of phase B peak to RMS current
Current Crest Factor Ph C	The ratio of phase C peak to RMS current
Current Load Ph A	The percentage of phase A RMS current to the rated capacity
Current Load Ph B	The percentage of phase B RMS current to the rated capacity
Current Load Ph C	The percentage of phase C RMS current to the rated capacity
Current Ph A	The RMS current of phase A
Current Ph B	The RMS current of phase B
Current Ph C	The RMS current of phase C
Energy	The total accumulated energy of the system since the last reset
Energy Reset	Set the total accumulated energy value to zero
External Input Contact State	The state of the external input contact
Ground Current	The RMS current of the ground
Ground Overcurrent	The ground current crossed above the threshold
Ground Overcurrent Alarm Threshold	The threshold for triggering a ground overcurrent alarm
Highest Phase Current Load	The highest percentage of phase RMS current to the rated capacity
Highest Phase K-Factor	The highest K-factor of all phases
Input 1 Frequency	The frequency of input 1 voltage
Input 1 Frequency Deviation	The frequency deviated beyond the threshold of input 1
Input 1 High Voltage THD	The voltage total harmonic distortion crossed above the threshold of input 1
Input 1 Invalid Phase Rotation	The phases are not in the expected sequence for input 1
Input 1 Overvoltage	The voltage crossed above the threshold of input 1
Input 1 Phase Loss	The voltage of one or more phases dropped below the threshold of input 1
Input 1 Phase Overvoltage Alarm Threshold	The threshold for triggering a phase overvoltage alarm of input 1
Input 1 Phase Undervoltage Alarm Threshold	The threshold for triggering a phase undervoltage alarm of input 1
Input 1 Undervoltage	The voltage crossed below the threshold of input 1
Input 1 Voltage (L-L) A-B	The RMS voltage between phase A and B
Input 1 Voltage (L-L) B-C	The RMS voltage between phase B and C
Input 1 Voltage (L-L) C-A	The RMS voltage between phase C and A

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
Input 1 Voltage 3rd Harmonic Ph A	The percentage of the 3rd harmonic present in phase A voltage of input 1 with respect to the fundamental frequency
Input 1 Voltage 3rd Harmonic Ph B	The percentage of the 3rd harmonic present in phase B voltage of input 1 with respect to the fundamental frequency
Input 1 Voltage 3rd Harmonic Ph C	The percentage of the 3rd harmonic present in phase C voltage of input 1 with respect to the fundamental frequency
Input 1 Voltage 5th Harmonic Ph A	The percentage of the 5th harmonic present in phase A voltage of input 1 with respect to the fundamental frequency
Input 1 Voltage 5th Harmonic Ph B	The percentage of the 5th harmonic present in phase B voltage of input 1 with respect to the fundamental frequency
Input 1 Voltage 5th Harmonic Ph C	The percentage of the 5th harmonic present in phase C voltage of input 1 with respect to the fundamental frequency
Input 1 Voltage 7th Harmonic Ph A	The percentage of the 7th harmonic present in phase A voltage of input 1 with respect to the fundamental frequency
Input 1 Voltage 7th Harmonic Ph B	The percentage of the 7th harmonic present in phase B voltage of input 1 with respect to the fundamental frequency
Input 1 Voltage 7th Harmonic Ph C	The percentage of the 7th harmonic present in phase C voltage of input 1 with respect to the fundamental frequency
Input 1 Voltage 9th Harmonic C	The percentage of the 9th harmonic present in phase C voltage of input 1 with respect to the fundamental frequency
Input 1 Voltage 9th Harmonic Ph A	The percentage of the 9th harmonic present in phase A voltage of input 1 with respect to the fundamental frequency
Input 1 Voltage 9th Harmonic Ph B	The percentage of the 9th harmonic present in phase B voltage of input 1 with respect to the fundamental frequency
Input 1 vTHD Ph A	The percentage of total harmonic distortion present in phase A voltage of input 1 with respect to the fundamental frequency
Input 1 vTHD Ph B	The percentage of total harmonic distortion present in phase B voltage of input 1 with respect to the fundamental frequency
Input 1 vTHD Ph C	The percentage of total harmonic distortion present in phase C voltage of input 1 with respect to the fundamental frequency
Input 2 Frequency	The frequency of input 2 voltage
Input 2 Frequency Deviation	The frequency deviated beyond the threshold of input 2
Input 2 High Voltage THD	The voltage total harmonic distortion crossed above the threshold of input 2
Input 2 Invalid Phase Rotation	The phases are not in the expected sequence for input 2
Input 2 Overvoltage	The voltage crossed above the threshold of input 2
Input 2 Phase Loss	The voltage of one or more phases dropped below the threshold of input 2
Input 2 Phase Overvoltage Alarm Threshold	The threshold for triggering a phase overvoltage alarm of input 2

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
Input 2 Phase Undervoltage Alarm Threshold	The threshold for triggering a phase undervoltage alarm of input 2
Input 2 Undervoltage	The voltage crossed below the threshold of input 2
Input 2 Voltage (L-L) A-B	The RMS voltage between phase A and B
Input 2 Voltage (L-L) B-C	The RMS voltage between phase B and C
Input 2 Voltage (L-L) C-A	The RMS voltage between phase C and A
Input 2 Voltage 3rd Harmonic Ph A	The percentage of the 3rd harmonic present in phase A voltage of input 2 with respect to the fundamental frequency
Input 2 Voltage 3rd Harmonic Ph B	The percentage of the 3rd harmonic present in phase B voltage of input 2 with respect to the fundamental frequency
Input 2 Voltage 3rd Harmonic Ph C	The percentage of the 3rd harmonic present in phase C voltage of input 2 with respect to the fundamental frequency
Input 2 Voltage 5th Harmonic Ph A	The percentage of the 5th harmonic present in phase A voltage of input 2 with respect to the fundamental frequency
Input 2 Voltage 5th Harmonic Ph B	The percentage of the 5th harmonic present in phase B voltage of input 2 with respect to the fundamental frequency
Input 2 Voltage 5th Harmonic Ph C	The percentage of the 5th harmonic present in phase C voltage of input 2 with respect to the fundamental frequency
Input 2 Voltage 7th Harmonic Ph A	The percentage of the 7th harmonic present in phase A voltage of input 2 with respect to the fundamental frequency
Input 2 Voltage 7th Harmonic Ph B	The percentage of the 7th harmonic present in phase B voltage of input 2 with respect to the fundamental frequency
Input 2 Voltage 7th Harmonic Ph C	The percentage of the 7th harmonic present in phase C voltage of input 2 with respect to the fundamental frequency
Input 2 Voltage 9th Harmonic Ph A	The percentage of the 9th harmonic present in phase A voltage of input 2 with respect to the fundamental frequency
Input 2 Voltage 9th Harmonic Ph B	The percentage of the 9th harmonic present in phase B voltage of input 2 with respect to the fundamental frequency
Input 2 Voltage 9th Harmonic Ph C	The percentage of the 9th harmonic present in phase C voltage of input 2 with respect to the fundamental frequency
Input 2 vTHD Ph A	The percentage of total harmonic distortion present in phase A voltage of input 2 with respect to the fundamental frequency
Input 2 vTHD Ph B	The percentage of total harmonic distortion present in phase B voltage of input 2 with respect to the fundamental frequency
Input 2 vTHD Ph C	The percentage of total harmonic distortion present in phase C voltage of input 2 with respect to the fundamental frequency
Internal Input Contact State	The state of the internal input contact
iTHD Ph A	The percentage of total harmonic distortion present in phase A current with respect to the fundamental frequency

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
iTHD Ph B	The percentage of total harmonic distortion present in phase B current with respect to the fundamental frequency
iTHD Ph C	The percentage of total harmonic distortion present in phase C current with respect to the fundamental frequency
K-Factor Ph A	The K-factor of phase A
K-Factor Ph B	The K-factor of phase B
K-Factor Ph C	The K-factor of phase C
Load Loss Detected	Load loss detected.
Load Loss Min Load	Load Loss Minimum Load
Main Input Breaker 1 Accessory Error	The main input circuit breaker 1 reported an invalid state
Main Input Breaker 1 Open Fail	The main input circuit breaker 1 failed to open as commanded
Main Input Breaker 1 Status	The operating status of main input breaker 1
Main Input Breaker 1 Tripped	The main input circuit breaker 1 reported a tripped state
Main Input Breaker 2 Accessory Error	The main input circuit breaker 2 reported an invalid state
Main Input Breaker 2 Open Fail	The main input circuit breaker 2 failed to open as commanded
Main Input Breaker 2 Status	The operating status of main input breaker 2
Main Input Breaker 2 Tripped	The main input circuit breaker 2 reported a tripped state
Metering Board Communication Fail	The metering board(s) reported a communication failure
Metering Configuration	The configuration of the system current transformers (CTs)
Neutral Current	The RMS current of the neutral
Neutral Overcurrent	The neutral current crossed above the threshold
Neutral Overcurrent Alarm Threshold	The threshold for triggering a neutral overcurrent alarm
Neutral Overcurrent Warning Threshold	The threshold for triggering a neutral overcurrent warning
Output Frequency Deviation	The output frequency deviated beyond the threshold
Output Overvoltage	The output voltage crossed above the threshold
Output Phase Overvoltage Alarm Threshold	The threshold for triggering a phase overvoltage alarm of the output
Output Phase Undervoltage Alarm Threshold	The threshold for triggering a phase undervoltage alarm of the output
Output Undervoltage	The output voltage crossed below the threshold
Output Voltage (L-L) A-B	The RMS voltage between phase A and B
Output Voltage (L-L) B-C	The RMS voltage between phase B and C
Output Voltage (L-L) C-A	The RMS voltage between phase C and A
Output Voltage (L-N) A-N	The RMS voltage between phase A and neutral

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
Output Voltage (L-N) B-N	The RMS voltage between phase B and neutral
Output Voltage (L-N) C-N	The RMS voltage between phase C and neutral
Output Voltage 3rd Harmonic A	The percentage of the 3rd harmonic present in phase A voltage of the output with respect to the fundamental frequency
Output Voltage 3rd Harmonic B	The percentage of the 3rd harmonic present in phase B voltage of the output with respect to the fundamental frequency
Output Voltage 3rd Harmonic C	The percentage of the 3rd harmonic present in phase C voltage of the output with respect to the fundamental frequency
Output Voltage 5th Harmonic A	The percentage of the 5th harmonic present in phase A voltage of the output with respect to the fundamental frequency
Output Voltage 5th Harmonic B	The percentage of the 5th harmonic present in phase B voltage of the output with respect to the fundamental frequency
Output Voltage 5th Harmonic C	The percentage of the 5th harmonic present in phase C voltage of the output with respect to the fundamental frequency
Output Voltage 7th Harmonic A	The percentage of the 7th harmonic present in phase A voltage of the output with respect to the fundamental frequency
Output Voltage 7th Harmonic B	The percentage of the 7th harmonic present in phase B voltage of the output with respect to the fundamental frequency
Output Voltage 7th Harmonic C	The percentage of the 7th harmonic present in phase C voltage of the output with respect to the fundamental frequency
Output Voltage 9th Harmonic A	The percentage of the 9th harmonic present in phase A voltage of the output with respect to the fundamental frequency
Output Voltage 9th Harmonic B	The percentage of the 9th harmonic present in phase B voltage of the output with respect to the fundamental frequency
Output Voltage 9th Harmonic C	The percentage of the 9th harmonic present in phase C voltage of the output with respect to the fundamental frequency
Output vTHD Ph A	The percentage of total harmonic distortion present in phase A voltage of the output with respect to the fundamental frequency
Output vTHD Ph B	The percentage of total harmonic distortion present in phase B voltage of the output with respect to the fundamental frequency
Output vTHD Ph C	The percentage of total harmonic distortion present in phase C voltage of the output with respect to the fundamental frequency
Overtemperature Shutdown	Will the system shutdown when there is an overtemperature alarm
Panelboard Apparent Power	The total apparent power of all phases of the panelboard
Panelboard Apparent Power	The total apparent power of all phases of the panelboard
Panelboard Available Pole Positions	The available number of pole positions within the panelboard
Panelboard Current 3rd Harmonic Ph A	The percentage of the 3rd harmonic present in phase A current with respect to the fundamental frequency of the panelboard

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
Panelboard Current 3rd Harmonic Ph A	The percentage of the 3rd harmonic present in phase A current with respect to the fundamental frequency of the panelboard
Panelboard Current 3rd Harmonic Ph B	The percentage of the 3rd harmonic present in phase B current with respect to the fundamental frequency of the panelboard
Panelboard Current 3rd Harmonic Ph B	The percentage of the 3rd harmonic present in phase B current with respect to the fundamental frequency of the panelboard
Panelboard Current 3rd Harmonic Ph C	The percentage of the 3rd harmonic present in phase C current with respect to the fundamental frequency of the panelboard
Panelboard Current 3rd Harmonic Ph C	The percentage of the 3rd harmonic present in phase C current with respect to the fundamental frequency of the panelboard
Panelboard Current 5th Harmonic Ph A	The percentage of the 5th harmonic present in phase A current with respect to the fundamental frequency of the panelboard
Panelboard Current 5th Harmonic Ph A	The percentage of the 5th harmonic present in phase A current with respect to the fundamental frequency of the panelboard
Panelboard Current 5th Harmonic Ph B	The percentage of the 5th harmonic present in phase B current with respect to the fundamental frequency of the panelboard
Panelboard Current 5th Harmonic Ph B	The percentage of the 5th harmonic present in phase B current with respect to the fundamental frequency of the panelboard
Panelboard Current 5th Harmonic Ph C	The percentage of the 5th harmonic present in phase C current with respect to the fundamental frequency of the panelboard
Panelboard Current 5th Harmonic Ph C	The percentage of the 5th harmonic present in phase C current with respect to the fundamental frequency of the panelboard
Panelboard Current 7th Harmonic Ph A	The percentage of the 7th harmonic present in phase A current with respect to the fundamental frequency of the panelboard
Panelboard Current 7th Harmonic Ph A	The percentage of the 7th harmonic present in phase A current with respect to the fundamental frequency of the panelboard
Panelboard Current 7th Harmonic Ph B	The percentage of the 7th harmonic present in phase B current with respect to the fundamental frequency of the panelboard
Panelboard Current 7th Harmonic Ph B	The percentage of the 7th harmonic present in phase B current with respect to the fundamental frequency of the panelboard
Panelboard Current 7th Harmonic Ph C	The percentage of the 7th harmonic present in phase C current with respect to the fundamental frequency of the panelboard
Panelboard Current 7th Harmonic Ph C	The percentage of the 7th harmonic present in phase C current with respect to the fundamental frequency of the panelboard
Panelboard Current 9th Harmonic Ph A	The percentage of the 9th harmonic present in phase A current with respect to the fundamental frequency of the panelboard
Panelboard Current 9th Harmonic Ph A	The percentage of the 9th harmonic present in phase A current with respect to the fundamental frequency of the panelboard
Panelboard Current 9th Harmonic Ph B	The percentage of the 9th harmonic present in phase B current with respect to the fundamental frequency of the panelboard

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
Panelboard Current 9th Harmonic Ph B	The percentage of the 9th harmonic present in phase B current with respect to the fundamental frequency of the panelboard
Panelboard Current 9th Harmonic Ph C	The percentage of the 9th harmonic present in phase C current with respect to the fundamental frequency of the panelboard
Panelboard Current 9th Harmonic Ph C	The percentage of the 9th harmonic present in phase C current with respect to the fundamental frequency of the panelboard
Panelboard Current Crest Factor Ph A	The ratio of phase A peak to RMS current for the panelboard
Panelboard Current Crest Factor Ph A	The ratio of phase A peak to RMS current for the panelboard
Panelboard Current Crest Factor Ph B	The ratio of phase B peak to RMS current for the panelboard
Panelboard Current Crest Factor Ph B	The ratio of phase B peak to RMS current for the panelboard
Panelboard Current Crest Factor Ph C	The ratio of phase C peak to RMS current for the panelboard
Panelboard Current Crest Factor Ph C	The ratio of phase C peak to RMS current for the panelboard
Panelboard Current Load Ph A	The percentage of phase A RMS current to the rated capacity of the panelboard
Panelboard Current Load Ph A	The percentage of phase A RMS current to the rated capacity of the panelboard
Panelboard Current Load Ph B	The percentage of phase B RMS current to the rated capacity of the panelboard
Panelboard Current Load Ph B	The percentage of phase B RMS current to the rated capacity of the panelboard
Panelboard Current Load Ph C	The percentage of phase C RMS current to the rated capacity of the panelboard
Panelboard Current Load Ph C	The percentage of phase C RMS current to the rated capacity of the panelboard
Panelboard Current Ph A	The RMS current of phase A of the panelboard
Panelboard Current Ph A	The RMS current of phase A of the panelboard
Panelboard Current Ph B	The RMS current of phase B of the panelboard
Panelboard Current Ph B	The RMS current of phase B of the panelboard
Panelboard Current Ph C	The RMS current of phase C of the panelboard
Panelboard Current Ph C	The RMS current of phase C of the panelboard
Panelboard Energy	The total accumulated energy of the panelboard since the last reset
Panelboard Energy	The total accumulated energy of the panelboard since the last reset
Panelboard Frequency	The frequency of the panelboard voltage
Panelboard Frequency Deviation	The panelboard frequency deviated beyond the threshold
Panelboard Frequency Deviation	The panelboard frequency deviated beyond the threshold
Panelboard Energy Reset	Set the total accumulated energy value of the panelboard to zero
Panelboard Energy Reset	Set the total accumulated energy value of the panelboard to zero
Panelboard Ground Current	The RMS current of the ground of the panelboard
Panelboard Ground Current	The RMS current of the ground of the panelboard
Panelboard Ground Overcurrent	The ground current crossed above the threshold of the panelboard

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
Panelboard Ground Overcurrent	The ground current crossed above the threshold of the panelboard
Panelboard Ground Overcurrent Alarm Threshold	The threshold for triggering a ground overcurrent alarm of the panelboard
Panelboard Ground Overcurrent Alarm Threshold	The threshold for triggering a ground overcurrent alarm of the panelboard
Panelboard Highest Phase Current Load	The highest percentage of phase RMS current to the rated capacity of the panelboard
Panelboard Highest Phase Current Load	The highest percentage of phase RMS current to the rated capacity of the panelboard
Panelboard Highest Phase Peak Current	The highest peak RMS current of all phases of the panelboard
Panelboard Highest Phase Peak Current	The highest peak RMS current of all phases of the panelboard
Panelboard iTHD Ph A	The percentage of total harmonic distortion present in phase A current with respect to the fundamental frequency of the panelboard
Panelboard iTHD Ph A	The percentage of total harmonic distortion present in phase A current with respect to the fundamental frequency of the panelboard
Panelboard iTHD Ph B	The percentage of total harmonic distortion present in phase B current with respect to the fundamental frequency of the panelboard
Panelboard iTHD Ph B	The percentage of total harmonic distortion present in phase B current with respect to the fundamental frequency of the panelboard
Panelboard iTHD Ph C	The percentage of total harmonic distortion present in phase C current with respect to the fundamental frequency of the panelboard
Panelboard iTHD Ph C	The percentage of total harmonic distortion present in phase C current with respect to the fundamental frequency of the panelboard
Panelboard Main Breaker Accessory Error	The main panelboard circuit breaker reported an invalid state
Panelboard Main Breaker Accessory Error	The main panelboard circuit breaker reported an invalid state
Panelboard Main Breaker Current Rating	The RMS current rating of the main circuit breaker
Panelboard Main Breaker Open Fail	The main panelboard circuit breaker failed to open when tripped.
Panelboard Main Breaker Status	The operating status of the main panelboard circuit breaker
Panelboard Main Breaker Status	The operating status of the main panelboard circuit breaker
Panelboard Main Breaker Tripped	The main panelboard circuit breaker reported a tripped state
Panelboard Main Breaker Tripped	The main panelboard circuit breaker reported a tripped state
Panelboard Neutral Current	The RMS current of the neutral of the panelboard
Panelboard Neutral Current	The RMS current of the neutral of the panelboard
Panelboard Neutral Overcurrent	The neutral current crossed above the threshold of the panelboard
Panelboard Neutral Overcurrent	The neutral current crossed above the threshold of the panelboard
Panelboard Neutral Overcurrent Alarm Threshold	The threshold for triggering a neutral overcurrent alarm of the panelboard

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
Panelboard Neutral Overcurrent Alarm Threshold	The threshold for triggering a neutral overcurrent alarm of the panelboard
Panelboard Neutral Overcurrent Warning Threshold	The neutral current crossed above the warning threshold of the panelboard
Panelboard Neutral Overcurrent Warning Threshold	The threshold for triggering a neutral overcurrent warning of the panelboard
Panelboard Overvoltage	The panelboard voltage crossed above the threshold
Panelboard Overvoltage	The Panelboard voltage crossed above the threshold
Panelboard Peak Current Ph A	The peak RMS current of phase A of the panelboard
Panelboard Peak Current Ph A	The peak RMS current of phase A of the panelboard
Panelboard Peak Current Ph B	The peak RMS current of phase B of the panelboard
Panelboard Peak Current Ph B	The peak RMS current of phase B of the panelboard
Panelboard Peak Current Ph C	The peak RMS current of phase C of the panelboard
Panelboard Peak Current Ph C	The peak RMS current of phase C of the panelboard
Panelboard Peak Current Reset	Set the peak current value of the panelboard to zero
Panelboard Peak Current Reset	Set the peak current value of the panelboard to zero
Panelboard Peak Demand	The peak demand of all phases of the panelboard
Panelboard Peak Demand	The peak demand of all phases of the panelboard
Panelboard Peak Demand Reset	Set the peak demand value of the panelboard to zero
Panelboard Peak Demand Reset	Set the peak demand value of the panelboard to zero
Panelboard Phase Overcurrent	The phase current crossed above the threshold of the panelboard
Panelboard Phase Overcurrent	The phase current crossed above the threshold of the panelboard
Panelboard Phase Overcurrent Alarm Threshold	The threshold for triggering a phase overcurrent alarm of the panelboard
Panelboard Phase Overcurrent Alarm Threshold	The threshold for triggering a phase overcurrent alarm of the panelboard
Panelboard Phase Overcurrent Warning Threshold	The threshold for triggering a phase overcurrent warning of the panelboard
Panelboard Phase Overcurrent Warning Threshold	The threshold for triggering a phase overcurrent warning of the panelboard
Panelboard Phase Overvoltage Alarm Threshold	The threshold for triggering a phase overvoltage alarm of the panelboard
Panelboard Phase Overvoltage Alarm Threshold	The threshold for triggering a phase overvoltage alarm of the subfeed panelboard
Panelboard Phase Undervoltage Alarm Threshold	The threshold for triggering a phase undervoltage alarm of the panelboard

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
Panelboard Phase Undervoltage Alarm Threshold	The threshold for triggering a phase undervoltage alarm of the subfeed panelboard
Panelboard Power Factor Ph A	The ratio of phase A real to apparent power for the panelboard
Panelboard Power Factor Ph A	The ratio of phase A real to apparent power for the panelboard
Panelboard Power Factor Ph B	The ratio of phase B real to apparent power for the panelboard
Panelboard Power Factor Ph B	The ratio of phase B real to apparent power for the panelboard
Panelboard Power Factor Ph C	The ratio of phase C real to apparent power for the panelboard
Panelboard Power Factor Ph C	The ratio of phase C real to apparent power for the panelboard
Panelboard Power Factor Total	The ratio of real to apparent power for the sum of all phases of the panelboard
Panelboard Power Factor Total	The ratio of real to apparent power for the sum of all phases of the panelboard
Panelboard Real Power	The total real (active) power of all phases of the panelboard
Panelboard Real Power	The total real (active) power of all phases of the panelboard
Panelboard Status	The operating status of the panelboard
Panelboard Status	The operating status of the panelboard
Panelboard Subfeed Count	The count of circuit breakers within the panelboard
Panelboard Total Pole Positions	The total number of pole positions within the panelboard
Panelboard Undervoltage	The panelboard voltage crossed below the threshold
Panelboard Undervoltage	The panelboard voltage crossed below the threshold
Panelboard Voltage (L-L) A-B	The RMS voltage between phase A and B of the panelboard
Panelboard Voltage (L-L) B-C	The RMS voltage between phase B and C of the panelboard
Panelboard Voltage (L-L) C-A	The RMS voltage between phase C and A of the panelboard
Panelboard Voltage (L-N) A-N	The RMS voltage between phase A and neutral of the panelboard
Panelboard Voltage (L-N) B-N	The RMS voltage between phase B and neutral of the panelboard
Panelboard Voltage (L-N) C-N	The RMS voltage between phase C and neutral of the panelboard
Panelboard Voltage 3rd Harmonic Ph A	The percentage of the 3rd harmonic present in phase A voltage with respect to the fundamental frequency of the panelboard
Panelboard Voltage 3rd Harmonic Ph B	The percentage of the 3rd harmonic present in phase B voltage with respect to the fundamental frequency of the panelboard
Panelboard Voltage 3rd Harmonic Ph C	The percentage of the 3rd harmonic present in phase C voltage with respect to the fundamental frequency of the panelboard
Panelboard Voltage 5th Harmonic Ph A	The percentage of the 5th harmonic present in phase A voltage with respect to the fundamental frequency of the panelboard
Panelboard Voltage 5th Harmonic Ph B	The percentage of the 5th harmonic present in phase B voltage with respect to the fundamental frequency of the panelboard

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
Panelboard Voltage 5th Harmonic Ph C	The percentage of the 5th harmonic present in phase C voltage with respect to the fundamental frequency of the panelboard
Panelboard Voltage 7th Harmonic Ph A	The percentage of the 7th harmonic present in phase A voltage with respect to the fundamental frequency of the panelboard
Panelboard Voltage 7th Harmonic Ph B	The percentage of the 7th harmonic present in phase B voltage with respect to the fundamental frequency of the panelboard
Panelboard Voltage 7th Harmonic Ph C	The percentage of the 7th harmonic present in phase C voltage with respect to the fundamental frequency of the panelboard
Panelboard Voltage 9th Harmonic Ph A	The percentage of the 9th harmonic present in phase A voltage with respect to the fundamental frequency of the panelboard
Panelboard Voltage 9th Harmonic Ph B	The percentage of the 9th harmonic present in phase B voltage with respect to the fundamental frequency of the panelboard
Panelboard Voltage 9th Harmonic Ph C	The percentage of the 9th harmonic present in phase C voltage with respect to the fundamental frequency of the panelboard
Panelboard vTHD Ph A	The percentage of total harmonic distortion present in phase A voltage with respect to the fundamental frequency of the panelboard
Panelboard vTHD Ph B	The percentage of total harmonic distortion present in phase B voltage with respect to the fundamental frequency of the panelboard
Panelboard vTHD Ph C	The percentage of total harmonic distortion present in phase C voltage with respect to the fundamental frequency of the panelboard
Peak Current Ph A	The peak RMS current of phase A
Peak Current Ph B	The peak RMS current of phase B
Peak Current Ph C	The peak RMS current of phase C
Peak Current Reset	Set the peak current value to zero
Peak Demand	The peak demand of all phases
Peak Demand Reset	Set the peak demand value to zero
Phase Overcurrent	The phase current crossed above the threshold
Phase Overcurrent Alarm Threshold	The threshold for triggering a phase overcurrent alarm
Phase Overcurrent Warning Threshold	The threshold for triggering a phase overcurrent warning
Power Factor Ph A	The ratio of phase A real to apparent power
Power Factor Ph B	The ratio of phase B real to apparent power
Power Factor Ph C	The ratio of phase C real to apparent power
Power Factor Total	The ratio of real to apparent power for the sum of all phases
Real Power	The total real (active) power of all phases
Restart Procedure	Will the system automatically restart or need a manual interaction
Server Class	The general classification for this system

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
Subfeed Apparent Power	The total apparent power of all phases of the subfeed
Subfeed Apparent Power	The total apparent power of all phases of the subfeed
Subfeed Breaker Accessory Error	The subfeed circuit breaker reported an invalid state
Subfeed Breaker Accessory Error	The subfeed circuit breaker reported an invalid state
Subfeed Breaker Status	The operating status of the subfeed circuit breaker
Subfeed Breaker Tripped	The subfeed circuit breaker reported a tripped state
Subfeed Breaker Tripped	The subfeed circuit breaker reported a tripped state
Subfeed Current 3rd Harmonic Ph A	The percentage of the 3rd harmonic present in phase A current of the subfeed with respect to the fundamental frequency
Subfeed Current 3rd Harmonic Ph A	The percentage of the 3rd harmonic present in phase A current of the subfeed with respect to the fundamental frequency
Subfeed Current 3rd Harmonic Ph B	The percentage of the 3rd harmonic present in phase B current of the subfeed with respect to the fundamental frequency
Subfeed Current 3rd Harmonic Ph B	The percentage of the 3rd harmonic present in phase B current of the subfeed with respect to the fundamental frequency
Subfeed Current 3rd Harmonic Ph C	The percentage of the 3rd harmonic present in phase C current of the subfeed with respect to the fundamental frequency
Subfeed Current 3rd Harmonic Ph C	The percentage of the 3rd harmonic present in phase C current of the subfeed with respect to the fundamental frequency
Subfeed Current 5th Harmonic Ph A	The percentage of the 5th harmonic present in phase A current of the subfeed with respect to the fundamental frequency
Subfeed Current 5th Harmonic Ph A	The percentage of the 5th harmonic present in phase A current of the subfeed with respect to the fundamental frequency
Subfeed Current 5th Harmonic Ph B	The percentage of the 5th harmonic present in phase B current of the subfeed with respect to the fundamental frequency
Subfeed Current 5th Harmonic Ph B	The percentage of the 5th harmonic present in phase B current of the subfeed with respect to the fundamental frequency
Subfeed Current 5th Harmonic Ph C	The percentage of the 5th harmonic present in phase C current of the subfeed with respect to the fundamental frequency
Subfeed Current 5th Harmonic Ph C	The percentage of the 5th harmonic present in phase C current of the subfeed with respect to the fundamental frequency
Subfeed Current 7th Harmonic Ph A	The percentage of the 7th harmonic present in phase A current of the subfeed with respect to the fundamental frequency
Subfeed Current 7th Harmonic Ph A	The percentage of the 7th harmonic present in phase A current of the subfeed with respect to the fundamental frequency
Subfeed Current 7th Harmonic Ph B	The percentage of the 7th harmonic present in phase B current of the subfeed with respect to the fundamental frequency
Subfeed Current 7th Harmonic Ph B	The percentage of the 7th harmonic present in phase B current of the subfeed with respect to the fundamental frequency

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
Subfeed Current 7th Harmonic Ph C	The percentage of the 7th harmonic present in phase C current of the subfeed with respect to the fundamental frequency
Subfeed Current 7th Harmonic Ph C	The percentage of the 7th harmonic present in phase C current of the subfeed with respect to the fundamental frequency
Subfeed Current 9th Harmonic Ph A	The percentage of the 9th harmonic present in phase A current of the subfeed with respect to the fundamental frequency
Subfeed Current 9th Harmonic Ph A	The percentage of the 9th harmonic present in phase A current of the subfeed with respect to the fundamental frequency
Subfeed Current 9th Harmonic Ph B	The percentage of the 9th harmonic present in phase B current of the subfeed with respect to the fundamental frequency
Subfeed Current 9th Harmonic Ph B	The percentage of the 9th harmonic present in phase B current of the subfeed with respect to the fundamental frequency
Subfeed Current 9th Harmonic Ph C	The percentage of the 9th harmonic present in phase C current of the subfeed with respect to the fundamental frequency
Subfeed Current 9th Harmonic Ph C	The percentage of the 9th harmonic present in phase C current of the subfeed with respect to the fundamental frequency
Subfeed Current Crest Factor Ph A	The ratio of phase A peak to RMS current for the subfeed
Subfeed Current Crest Factor Ph A	The ratio of phase A peak to RMS current for the subfeed
Subfeed Current Crest Factor Ph B	The ratio of phase B peak to RMS current for the subfeed
Subfeed Current Crest Factor Ph B	The ratio of phase B peak to RMS current for the subfeed
Subfeed Current Crest Factor Ph C	The ratio of phase C peak to RMS current for the subfeed
Subfeed Current Crest Factor Ph C	The ratio of phase C peak to RMS current for the subfeed
Subfeed Current Load Ph A	The percentage of phase A RMS current to the rated capacity of the subfeed
Subfeed Current Load Ph A	The percentage of phase A RMS current to the rated capacity of the subfeed
Subfeed Current Load Ph B	The percentage of phase B RMS current to the rated capacity of the subfeed
Subfeed Current Load Ph B	The percentage of phase B RMS current to the rated capacity of the subfeed
Subfeed Current Load Ph C	The percentage of phase C RMS current to the rated capacity of the subfeed
Subfeed Current Load Ph C	The percentage of phase C RMS current to the rated capacity of the subfeed
Subfeed Current Ph A	The RMS current of phase A of the subfeed
Subfeed Current Ph A	The RMS current of phase A of the subfeed
Subfeed Current Ph B	The RMS current of phase B of the subfeed
Subfeed Current Ph B	The RMS current of phase B of the subfeed
Subfeed Current Ph C	The RMS current of phase C of the subfeed
Subfeed Current Ph C	The RMS current of phase C of the subfeed
Subfeed Current Rating	The RMS current rating of the subfeed circuit breaker
Subfeed Current Rating	The RMS current rating of the subfeed circuit breaker

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
Subfeed Energy	The total accumulated energy of the subfeed since the last reset
Subfeed Energy	The total accumulated energy of the subfeed since the last reset
Subfeed Energy Reset	Set the total accumulated energy value of the subfeed to zero
Subfeed Energy Reset	Set the total accumulated energy value of the subfeed to zero
Subfeed Frequency	The frequency of the subfeed voltage
Subfeed Frequency Deviation	The subfeed frequency deviated beyond the threshold
Subfeed Ground Current	The RMS current of the ground of the subfeed
Subfeed Ground Current	The RMS current of the ground of the subfeed
Subfeed Ground Overcurrent	The ground current crossed above the threshold of the subfeed
Subfeed Ground Overcurrent	The ground current crossed above the threshold of the subfeed
Subfeed Ground Overcurrent Alarm Threshold	The threshold for triggering a ground overcurrent alarm of the subfeed
Subfeed Highest Phase Current Load	The highest percentage of phase RMS current to the rated capacity of the subfeed
Subfeed Highest Phase Current Load	The highest percentage of phase RMS current to the rated capacity of the subfeed
Subfeed Highest Phase Peak Current	The highest peak RMS current of all phases of the subfeed
Subfeed Highest Phase Peak Current	The highest peak RMS current of all phases of the subfeed
Subfeed iTHD Ph A	The percentage of total harmonic distortion present in phase A current of the subfeed with respect to the fundamental frequency
Subfeed iTHD Ph A	The percentage of total harmonic distortion present in phase A current of the subfeed with respect to the fundamental frequency
Subfeed iTHD Ph B	The percentage of total harmonic distortion present in phase B current of the subfeed with respect to the fundamental frequency
Subfeed iTHD Ph B	The percentage of total harmonic distortion present in phase B current of the subfeed with respect to the fundamental frequency
Subfeed iTHD Ph C	The percentage of total harmonic distortion present in phase C current of the subfeed with respect to the fundamental frequency
Subfeed iTHD Ph C	The percentage of total harmonic distortion present in phase C current of the subfeed with respect to the fundamental frequency
Subfeed Main Breaker Status	The operating status of the subfeed circuit breaker
Subfeed Neutral Current	The RMS current of the neutral of the subfeed
Subfeed Neutral Current	The RMS current of the neutral of the subfeed
Subfeed Neutral Overcurrent	The neutral current crossed above the threshold of the subfeed
Subfeed Neutral Overcurrent	The neutral current crossed above the threshold of the subfeed
Subfeed Neutral Overcurrent Threshold	The threshold for triggering a neutral overcurrent alarm of the subfeed
Subfeed Neutral Overcurrent Threshold	The threshold for triggering a neutral overcurrent alarm of the subfeed

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
Subfeed Neutral Overcurrent Warning Threshold	The threshold for triggering a neutral overcurrent warning of the subfeed
Subfeed Neutral Overcurrent Warning Threshold	The threshold for triggering a neutral overcurrent warning of the subfeed
Subfeed Overvoltage	The subfeed voltage crossed above the threshold
Subfeed Peak Current Ph A	The peak RMS current of phase A of the subfeed
Subfeed Peak Current Ph A	The peak RMS current of phase A of the subfeed
Subfeed Peak Current Ph B	The peak RMS current of phase B of the subfeed
Subfeed Peak Current Ph B	The peak RMS current of phase B of the subfeed
Subfeed Peak Current Ph C	The peak RMS current of phase C of the subfeed
Subfeed Peak Current Ph C	The peak RMS current of phase C of the subfeed
Subfeed Peak Current Reset	Set the peak current value of the subfeed to zero
Subfeed Peak Current Reset	Set the peak current value of the subfeed to zero
Subfeed Peak Demand	The peak demand of all phases of the subfeed
Subfeed Peak Demand	The peak demand of all phases of the subfeed
Subfeed Peak Demand Reset	Set the peak demand value of the subfeed to zero
Subfeed Peak Demand Reset	Set the peak demand value of the subfeed to zero
Subfeed Phase Overcurrent	The phase current crossed above the threshold of the subfeed
Subfeed Phase Overcurrent	The phase current crossed above the threshold of the subfeed
Subfeed Phase Overcurrent Alarm Threshold	The threshold for triggering a phase overcurrent alarm of the subfeed
Subfeed Phase Overcurrent Alarm Threshold	The threshold for triggering a phase overcurrent alarm of the subfeed
Subfeed Phase Overcurrent Warning Threshold	The threshold for triggering a phase overcurrent warning of the subfeed
Subfeed Phase Overcurrent Warning Threshold	The threshold for triggering a phase overcurrent warning of the subfeed
Subfeed Phase Overvoltage Alarm Threshold	The threshold for triggering a phase overvoltage alarm of the subfeed
Subfeed Phase Undervoltage Alarm Threshold	The threshold for triggering a phase undervoltage alarm of the subfeed
Subfeed Power Factor Ph A	The ratio of phase A real to apparent power for the subfeed
Subfeed Power Factor Ph A	The ratio of phase A real to apparent power for the subfeed
Subfeed Power Factor Ph B	The ratio of phase B real to apparent power for the subfeed
Subfeed Power Factor Ph B	The ratio of phase B real to apparent power for the subfeed
Subfeed Power Factor Ph C	The ratio of phase C real to apparent power for the subfeed

Table 3.86 Liebert® RXA and Liebert® TFX—Glossary (continued)

Data Label	Description
Subfeed Power Factor Ph C	The ratio of phase C real to apparent power for the subfeed
Subfeed Power Factor Total	The ratio of real to apparent power for the sum of all phases of the subfeed
Subfeed Power Factor Total	The ratio of real to apparent power for the sum of all phases of the subfeed
Subfeed Real Power	The total real (active) power of all phases of the subfeed
Subfeed Real Power	The total real (active) power of all phases of the subfeed
Subfeed Undervoltage	The subfeed voltage crossed below the threshold
Subfeed Voltage (L-L) A-B	The RMS voltage between phase A and B of the subfeed
Subfeed Voltage (L-L) B-C	The RMS voltage between phase B and C of the subfeed
Subfeed Voltage (L-L) C-A	The RMS voltage between phase C and A of the subfeed
Subfeed Voltage (L-N) A-N	The RMS voltage between phase A and neutral of the subfeed
Subfeed Voltage (L-N) B-N	The RMS voltage between phase B and neutral of the subfeed
Subfeed Voltage (L-N) C-N	The RMS voltage between phase C and neutral of the subfeed
System Current Rating	The current rating of the system
System Frequency	The frequency of the system.
System Misconfiguration	The system reported a misconfiguration
System Power Rating	The power rating of the system.
System Shutdown - EPO	Unit shutdown by Emergency Power Off (EPO) switch
System Shutdown - REPO	System shutdown due to Remote Emergency Power Off (REPO)
System Shutdown - Undervoltage	System shutdown due to an undervoltage condition
System Status	The operating status for the system
System-wide Energy Reset	Set all of the total accumulated energy values in the system to zero
System-wide Event Acknowledge/Reset	Reset and/or acknowledge all events.
System-wide Peak Current Reset	Set all of the peak current values in the system to zero
System-wide Peak Demand Reset	Set all of the peak demand values in the system to zero
Transformer High Temperature	The transformer crossed the high temperature threshold
Transformer Temperature Sensor Failure	The transformer temperature sensor is reporting an invalid state
Voltage Over THD Alarm Threshold	The threshold for triggering a voltage over total harmonic distortion alarm

If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.

Table 3.90 Liebert® STS2, Liebert® STS2/PDU—Glossary— Liebert® IS-UNITY-DP

Data Label	Data Description
Branch Current Phase 1	Branch breaker Phase 1 RMS current
Branch Current Phase 2	Branch Breaker Phase 2 RMS current
Branch Current Phase 3	Branch breaker Phase 3 RMS current
Branch Output Percent Load	Branch breaker percent load of rated current
Branch Output Power (W)	Branch breaker W
Branch Output Power Factor	Branch breaker Power Factor (real power/apparent power)
Branch Overcurrent	Branch breaker current has exceeded the limit.
Branch Undercurrent Warning	Branch breaker current is less than the limit.
Breaker position	Panelboard pole position of the branch breaker. First position if 2 or 3 pole breaker
Columns of Breakers	The breakers in this panel are physically arranged in this many columns.
Equipment Temperature Sensor Fail	Transformer temperature sensor has failed
Event State	Alarm present
Frequency Deviation	The output frequency is outside a specified range.
Ground Current	Unit Ground RMS current.
Ground Overcurrent	Unit ground current has exceeded the limit.
Input Voltage A-B	Unit Input RMS Voltage between Phase A and Phase B
Input Voltage B-C	Unit Input RMS Voltage between Phase B and Phase C
Input Voltage C-A	Unit Input RMS Voltage between Phase C and Phase A
Neutral Overcurrent	Unit neutral current has exceeded the limit.
Number of Breakers	Number of Breakers in this panelboard.
Output Current Ix Crest Factor	Unit phase X Current Crest Factor (peak/RMS).
Output Current Ix K-Factor	Unit output Current Harmonic K-Factor for phase X.

Table 3.90 Liebert®STS2, Liebert® STS2/PDU—Glossary— Liebert® IS-UNITY-DP (continued)

Data Label	Data Description
Output Current Ix THD	Unit Current Total Harmonic Distortion for phase X.
Output Current Ix	Unit Phase X output RMS current.
Output Current Iy Crest Factor	Unit phase Y Current Crest Factor (peak/RMS).
Output Current Iy K-Factor	Unit output Current Harmonic K-Factor for phase Y.
Output Current Iy THD	Unit Current Total Harmonic Distortion for phase Y.
Output Current Iy	Unit Phase Y output RMS current.
Output Current Iz Crest Factor	Unit phase Z Current Crest Factor (peak/RMS).
Output Current Iz K-Factor	Unit output Current Harmonic K-Factor for phase Z.
Output Current Iz THD	Unit Current Total Harmonic Distortion for phase Z.
Output Current Iz	Unit Phase Z output RMS current.
Output Frequency	The system output frequency.
Output kW-Hrs	Branch Breaker accumulated KW-Hours since last KW-Hours reset.
Output kW-Hrs	Unit accumulated KW-Hours since last KW-Hours reset.
Output Neutral Current	Unit output Neutral RMS current.
Output Overcurrent	Unit phase current has exceeded the limit.
Output Overvoltage	Unit voltage has exceeded the limit.
Output Percent Load	Unit percent load of rated current
Output Power (kVA)	Unit output kVA
Output Power (kW)	Unit output KW
Output Power Factor	Unit output Power Factor (real power/apparent power)
Output Undervoltage	Unit voltage is less than the limit.
Output Voltage THD	Unit output Voltage Total Harmonic Distortion has exceeded the limit.
Output Voltage Vx THD	Unit Voltage Total Harmonic Distortion for phase X.
Output Voltage Vx	Unit output RMS voltage between phase X and Neutral
Output Voltage Vy THD	Unit Voltage Total Harmonic Distortion for phase Y.
Output Voltage Vy	Unit output RMS voltage between phase Y and Neutral
Output Voltage Vz THD	Unit Voltage Total Harmonic Distortion for phase Z.
Output Voltage Vz	Unit output RMS voltage between phase Z and Neutral
Output Voltage X-Y	Unit output RMS voltage between phases X and Y
Output Voltage Y-Z	Unit output RMS voltage between phases Y and Z.
Output Voltage Z-X	Unit output RMS voltage between phases Z and X.
Panel Ground Overcurrent	Panelboard Ground current has exceeded the limit.

Table 3.90 Liebert®STS2, Liebert® STS2/PDU—Glossary— Liebert® IS-UNITY-DP (continued)

Data Label	Data Description
Panel Main Current Ix Crest Factor	Panelboard phase X Current Crest Factor (peak/RMS).
Panel Main Current Ix THD	Current Total Harmonic Distortion for Panelboard phase X.
Panel Main Current Ix	Panelboard RMS current for phase X.
Panel Main Current Iy Crest Factor	Panelboard phase Y Current Crest Factor (peak/RMS).
Panel Main Current Iy THD	Current Total Harmonic Distortion for Panelboard phase Y.
Panel Main Current Iy	Panelboard RMS current for phase Y.
Panel Main Current Iz Crest Factor	Panelboard phase Z Current Crest Factor (peak/RMS).
Panel Main Current Iz THD	Current Total Harmonic Distortion for Panelboard phase Z.
Panel Main Current Iz	Panelboard RMS current for phase Z.
Panel Main Ground Current	Panelboard Ground RMS current.
Panel Main Neutral Current	Panelboard Neutral RMS current.
Panel Main Output kW-Hrs	Panelboard accumulated KW-Hours since last KW-Hours reset.
Panel Main Output Percent Load	Panelboard percent load of rated current
Panel Main Output Power (kVA)	Panelboard output kVA.
Panel Main Output Power (kW)	Panelboard output KW
Panel Main Output Power Factor	Panelboard Output Power Factor (real power/apparent power)
Panel Main Voltage Vx THD	Voltage Total Harmonic Distortion for Panelboard phase X.
Panel Main Voltage Vy THD	Voltage Total Harmonic Distortion for Panelboard phase Y.
Panel Main Voltage Vz THD	Voltage Total Harmonic Distortion for Panelboard phase Z.
Panel Main Voltage X-N	Panelboard RMS voltage between Phase X and Neutral.
Panel Main Voltage X-Y	Panelboard RMS voltage between phases X and Y.
Panel Main Voltage Y-N	Panelboard RMS voltage between Phase Y and Neutral.
Panel Main Voltage Y-Z	Panelboard RMS voltage between phases Y and Z.
Panel Main Voltage Z-N	Panelboard RMS voltage between Phase Z and Neutral.
Panel Main Voltage Z-X	Panelboard RMS voltage between phases Z and X.
Panel Neutral Overcurrent	Panelboard Neutral current has exceeded the limit.
Panel Overvoltage	Panelboard voltage has exceeded the limit.
Panel Phase Overcurrent	Panelboard phase current has exceeded the limit.
Panel Summary Alarm	Panelboard Summary Alarm. Annunciates upon occurrence of any branch or panelboard main breaker alarm.
Panel Undervoltage	Panelboard voltage is less than the limit.
Phase Loss	Voltage and/or Frequency on one or more of the phases is outside the limit.
Phase Rotation Error	Unit input phase sequence is not A, B, C. The phase sequence should be verified and corrected.

Table 3.90 Liebert®STS2, Liebert® STS2/PDU—Glossary— Liebert® IS-UNITY-DP (continued)

Data Label	Data Description
Subfeed Current Ix Crest Factor	Subfeed breaker phase X Current Crest Factor (peak/RMS).
Subfeed Current Ix THD	Current Total Harmonic Distortion for Subfeed breaker phase X.
Subfeed Current Ix	Subfeed breaker RMS current for phase X.
Subfeed Current Iy Crest Factor	Subfeed breaker phase Y Current Crest Factor (peak/RMS).
Subfeed Current Iy THD	Current Total Harmonic Distortion for Subfeed breaker phase Y.
Subfeed Current Iy	Subfeed breaker RMS current for phase Y.
Subfeed Current Iz Crest Factor	Subfeed breaker phase Z Current Crest Factor (peak/RMS).
Subfeed Current Iz THD	Current Total Harmonic Distortion for Subfeed breaker phase Z.
Subfeed Current Iz	Subfeed breaker RMS current for phase Z.
Subfeed Ground Current	Subfeed breaker Ground RMS current.
Subfeed Ground Overcurrent	Subfeed breaker Ground current has exceeded the limit.
Subfeed Neutral Current	Subfeed breaker Neutral RMS current.
Subfeed Neutral Overcurrent	Subfeed breaker Neutral current has exceeded the limit.
Subfeed Output kW-Hrs	Subfeed breaker accumulated KW-Hours since last KW-Hours reset.
Subfeed Output Percent Load	Subfeed breaker percent load of rated current
Subfeed Output Power (kVA)	Subfeed breaker output kVA.
Subfeed Output Power (kW)	Subfeed breaker output KW
Subfeed Phase Overcurrent	Subfeed breaker phase current has exceeded the limit.
Subfeed Power Factor	Subfeed breaker Power Factor (real power/apparent power)
System Date and Time	Unit date and time
System Event Acknowledge/Reset	Alarm Present/Reset
System Shutdown - EPO	Unit shutdown by Emergency Power Off (EPO) switch
System Shutdown - REPO	Unit shutdown by Remote Emergency Power Off (REPO) switch
System Status	The operating status for the system
Transformer Overtemperature Power Off	Output power shutdown due to high transformer temperature
Transformer Overtemperature Shutdown	Unit shutdown due to transformer over temperature
Transformer Overtemperature	Transformer temperature has exceeded the limit
Transformer Overtemperature	Transformer temperature has exceeded the limit
Transformer Temperature Sensor Fail	Transformer temperature sensor has failed

<i>If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.</i>					

Table 3.93 Liebert® APM, Liebert® NXC, Liebert® NXR—Glossary

Data Label	Data Description
Battery Auto Test In Progress	Automatic battery test is in progress.
Battery Capacity Low	Battery capacity is low.
Battery Charge Equalization Timeout	The battery equalizing is time out.
Battery Charging Error	The battery is not charging properly.
Battery Charging Inhibited	Battery charging is inhibited due to an external inhibit signal.
Battery Converter Failure	Battery converter failure. This is a summary event caused by one or more power sub-modules in a UPS module.
Battery Discharging	The battery is discharging.
Battery Equalize	The rectifier output voltage is increased to equalize the battery voltage level.
Battery Low	The calculated battery time remaining has reached the low battery threshold.
Battery Not Qualified	The UPS battery voltage is not qualified. This event will be detected even in the absence of battery disconnect or when it is open.
Battery Over Temperature	A battery temperature sensor is reporting a value above a threshold.
Battery Temperature for Cabinet	The battery temperature for a cabinet.
Battery Terminals Reversed	The measured battery voltage is a negative value due to reverse battery terminal connections.
Battery Time Remaining	The calculated available time on battery.
Battery Volts for Cabinet	The voltage between the positive and negative battery terminals of a battery cabinet.
Bypass - Excess Auto Retransfers	The number of auto retransfers, from bypass to inverter, has exceeded the maximum for a specified time interval.
Bypass Input Frequency	The bypass input frequency.
Bypass Input Voltage RMS A-N	The bypass input RMS voltage between Phase A and Neutral.
Bypass Input Voltage RMS B-N	The bypass input RMS voltage between Phase B and Neutral.
Bypass Input Voltage RMS C-N	The bypass input RMS voltage between Phase C and Neutral.
Bypass Not Available	A problem associated with the bypass has been detected.
Bypass Static Switch Unavailable	The static bypass is unavailable to support the critical load.
DC Bus Abnormal	The system has detected an abnormal DC Bus Voltage.
DC Bus Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value.
ECO Mode Operation State	This setting is used to enable or disable ECO Mode..

Table 3.93 Liebert® APM, Liebert® NXC, Liebert® NXR—Glossary (continued)

Data Label	Data Description
Equipment Over Temperature	Equipment over temperature summary event.
Fuse Failure	A summary event indicating one or more fuse failures.
Inlet Air Temperature	The temperature of the inlet air.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus.
Inverter Failure	Inverter failure - inverter output is off.
Inverter On/Off State	Inverter on/off state.
Inverter Overload Phase A	Inverter is operating with an overload on Phase A.
Inverter Overload Phase B	Inverter is operating with an overload on Phase B.
Inverter Overload Phase C	Inverter is operating with an overload on Phase C.
Inverter SCR Open	The system has detected an open across one or more inverter static switch Silicon Controlled Rectifiers.
Inverter Shutdown - Overload	The inverter has shutdown due to a sustained overload.
Inverter Static Switch SCR Short	The system has detected a short across one or more inverter static switch Silicon Controlled Rectifiers (SCR).
LBS Inhibited	The system has detected that conditions to perform Load Bus Sync are not satisfied.
Load Impact Transfer	On bypass as result of load impact.
Load Sharing Fault	Difference between any phase inverter current of unit and the relevant average output current of parallel system is more than a specific percent of nominal current.
Loss of Redundancy	The multi-module collection doesn't have enough modules to satisfy the redundancy configuration.
Main Battery Disconnect Open	Main battery disconnect is open.
Mains Input Neutral Lost	Loss of neutral in the input source is detected.
Maintenance Bypass Breaker	Maintenance bypass breaker.
MMS On Battery	The multi-module system is on battery.
MMS Output Apparent Power	The sum total apparent power of all system output modules.
MMS Output Power	The sum total power of all system output modules.
MMS Over Capacity	The multi-module system load is larger than the apparent power limit setting.
MMS Overload	Multi-module system overload.
On Generator	A generator is supplying the power to the system.
Output Current Crest Factor Phs A	Output current crest factor of Phase A.

Table 3.93 Liebert® APM, Liebert® NXC, Liebert® NXR—Glossary (continued)

Data Label	Data Description
Output Current Crest Factor Phs B	Output current crest factor of Phase B.
Output Current Crest Factor Phs C	Output current crest factor of Phase C.
Output Load on Maint. Bypass	The output power is supplied by the maintenance bypass.
Parallel Comm Warning	Parallel communication bus warning
Power Sub Module Fault	One or more failures detected in power module, inverter or rectifier.
Power Supply Failure	Power supply failure.
Rectifier Failure	Rectifier failure - rectifier is off.
System Date and Time	The system date and time
System Fan Failure	System fan failure - one or more fans have failed.
System Input Current Imbalance	System Input Currents are Imbalanced.
System Input Frequency	The system input frequency.
System Input Phs Rotation Error	The power conductors on the input line are not wired to the UPS in the sequence preferred for the rectifier (A-B-C).
System Input Power Factor Phs A	The system input power factor for Phase A.
System Input Power Factor Phs B	The system input power factor for Phase B.
System Input Power Factor Phs C	The system input power factor for Phase C.
System Input Power Phase A	The system input power on Phase A.
System Input Power Phase B	The system input power on Phase B.
System Input Power Phase C	The system input power on Phase C.
System Input Power Problem	The input is not qualified to provide power to the system.
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B.
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral.
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C.
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral.
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A.
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral.

Table 3.93 Liebert® APM, Liebert® NXC, Liebert® NXR—Glossary (continued)

Data Label	Data Description
System Input RMS Current Phase A	The system input RMS current for Phase A.
System Input RMS Current Phase B	The system input RMS current for Phase B.
System Input RMS Current Phase C	The system input RMS current for Phase C.
System Output Apparent Power	The sum total apparent power of all system output phases.
System Output Fault	A fault has been detected in the system output.
System Output Frequency	The system output frequency.
System Output Pct Power Phase A	The system output power on Phase A as a percentage of the rated capacity.
System Output Pct Power Phase B	The system output power on Phase B as a percentage of the rated capacity.
System Output Pct Power Phase C	The system output power on Phase C as a percentage of the rated capacity.
System Output Power Factor Phs A	The system output power factor of Phase A.
System Output Power Factor Phs B	The system output power factor of Phase B.
System Output Power Factor Phs C	The system output power factor of Phase C.
System Output Power Phase A	The system output power on Phase A.
System Output Power Phase B	The system output power on Phase B.
System Output Power Phase C	The system output power on Phase C.
System Output Power	The sum total power of all system output phases
System Output RMS Current Phs A	The system output RMS current for Phase A.
System Output RMS Current Phs B	The system output RMS current for Phase B.
System Output RMS Current Phs C	The system output RMS current for Phase C.
System Output Voltage RMS A-B	The system output RMS voltage between Phases A and B.
System Output Voltage RMS A-N	The system output RMS voltage between Phases A and Neutral.

Table 3.93 Liebert® APM, Liebert® NXC, Liebert® NXR—Glossary (continued)

Data Label	Data Description
System Output Voltage RMS B-C	The system output RMS voltage between Phases B and C.
System Output Voltage RMS B-N	The system output RMS voltage between Phases B and Neutral.
System Output Voltage RMS C-A	The system output RMS voltage between Phases C and A.
System Output Voltage RMS C-N	The system output RMS voltage between Phases C and Neutral.
System Shutdown - EPO	System shutdown due to Emergency Power Off (EPO).
System Status	The operating status for the system
Top Outlet Fan Fault	Top outlet fan fault - one or more top outlet fans have failed.
UPS battery1 status	UPS battery status.
UPS input real power	The magnitude of the present input true power (calculated on the three phases).
UPS Output on Bypass	The output power is supplied by the bypass.
UPS Output Source	UPS output source.
User Operation Invalid	User attempted an invalid operation..

System Date and Time	39998	49998	2		Units : Secs since Epoch(UTC)

Table 3.96 Liebert®APM 160—Glossary

Data Label	Data Description
Accumulated Discharge Time	Total accumulated discharge time for the Battery Module since it was made.
Application Mode For UPS	Application Mode for UPS.
ATS Status	The status of ATS
Automatic Battery Test	Enable/disable the automatic battery test schedule.
Average system efficiency	Average system efficiency
Battery Auto Test In Progress	Automatic battery test is in progress
Battery Breaker Open Failure	Battery circuit breaker failed to open
Battery Capacity Low	Battery capacity is low
Battery Charge Equalization Timeout	The battery equalizing is time out.
Battery Charge Status	Battery charge status.
Battery Charging Error	The battery is not charging properly
Battery Charging Inhibited	Battery charging is inhibited due to an external inhibit signal
Battery Circuit Breaker Open	Battery circuit breaker is open
Battery Converter Current Limit	The battery converter has reached is maximum current limit.
Battery Converter Failure	Battery converter failure. This is a summary event caused by one or more power sub-modules in a UPS module.
Battery Discharging	The battery is discharging
Battery Equalize	The rectifier output voltage is increased to equalize the battery voltage level.
Battery Ground Fault	Battery system ground fault amperage exceeds the threshold
Battery Low	The calculated battery time remaining has reached the low battery threshold
Battery Management System Fault	The Battery Management System has reported a Fault
Battery Management System General Warning	The Battery Management System has reported a General Warning

Table 3.96 Liebert®APM 160—Glossary (continued)

Data Label	Data Description
Battery Management System Rack is Offline Warning	The Battery Management System has reported a rack-is-offline warning
Battery Manual Test In Progress	Manual battery test is in progress
Battery Not Qualified	The UPS battery voltage is not qualified. This event will be detected even in the absence of battery disconnect or when it is open.
Battery Over Temperature	A battery temperature sensor is reporting a value above a threshold
Battery Over Voltage	The system has detected that the battery voltage has exceeded a predetermined limit.
Battery Percentage Charge	The percentage of battery charge
Battery Room Alarm	The ambient temperature of the battery room is abnormal.
Battery Self Test Cycle Time	The time between automatic battery self test cycles.
Battery Self Test	Battery self test is in progress
Battery Temperature for Cabinet	The battery temperature for a cabinet
Battery Temperature	The highest battery temperature among all Battery Cabinets
Battery Terminal Abnormal	Battery Terminal Abnormal
Battery Terminals Reversed	The measured battery voltage is a negative value due to reverse battery terminal connections.
Battery Test Failed	Battery test failed
Battery Test Passed	Battery test passed
Battery Time Remaining	The calculated available time on battery
Battery Volts for Cabinet	The voltage between the positive and negative battery terminals of a battery cabinet
Branch Active Power	The active power of the branch
Branch Apparent Power	The apparent power of the branch
Branch Breaker Fail	A failure has been detected with the branch breaker.
Branch Breaker	Branch Breaker
Branch Current Over HL	The current of pdu branch is over the high level.
Branch Current Over LL	The current of pdu branch is over the low level.
Branch Current Rating	The RMS current rating of the branch circuit breaker
Branch Current	The RMS current of the branch
Branch Energy	The total accumulated energy of the branch since the last reset
Branch Over Current	The PDU branch current is over limit.
Branch Phase Current Load	The percentage of phase RMS current to the rated capacity of the branch
Branch Power Factor	The ratio of real to apparent power for the branch
Branch THDI	Branch THDI
Branch Voltage	The voltage of the branch

Table 3.96 Liebert®APM 160—Glossary (continued)

Data Label	Data Description
Bypass - Excess Auto Retransfers	The number of auto retransfers, from bypass to inverter, has exceeded the maximum for a specified time interval
Bypass Apparent Power Phase A	The bypass apparent power on phase A
Bypass Apparent Power Phase B	The bypass apparent power on phase B
Bypass Apparent Power Phase C	The bypass apparent power on phase C
Bypass Backfeed Detected	The system detected a voltage on the bypass when none was expected
Bypass Control Module Not Available	The bypass control module is not available.
Bypass controlling the SCR autonomously	The bypass is controlling the SCR autonomously because not all inverters are online.
Bypass Input Frequency	The bypass input frequency
Bypass Input Voltage RMS A-B	The bypass input RMS voltage between phases A and B
Bypass Input Voltage RMS A-N	The bypass input RMS voltage between phase A and Neutral
Bypass Input Voltage RMS B-C	The bypass input RMS voltage between phases B and C
Bypass Input Voltage RMS B-N	The bypass input RMS voltage between phase B and Neutral
Bypass Input Voltage RMS C-A	The bypass input RMS voltage between phases C and A
Bypass Input Voltage RMS C-N	The bypass input RMS voltage between phase C and Neutral
Bypass Module Not Available	The bypass module is not available.
Bypass Nominal Voltage	Bypass nominal (or rated) voltage
Bypass Not Available	A problem associated with the bypass has been detected
Bypass Power Phase A	The bypass power on phase A
Bypass Power Phase B	The bypass power on phase B
Bypass Power Phase C	The bypass power on phase C
Bypass Static Switch Unavailable	The static bypass is unavailable to support the critical load.
Bypass Unable to Trace	The voltage amplitude or frequency of bypass is out of the range of trace.
DC Bus Abnormal	The system has detected an abnormal DC Bus Voltage.
DC Bus Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value
DC Bus Voltage	The voltage between the positive and negative terminals of the DC bus at the battery input
ECO Suspended Time Remaining	The time remaining before ECO mode is activated.
Equipment Over Temperature	Equipment over temperature summary event

Table 3.96 Liebert®APM 160—Glossary (continued)

Data Label	Data Description
Excess ECO Suspends	Number of automatic suspensions has exceeded the ECO Mode - Maximum Auto Suspensions setting.
External Bypass Breaker	The status of the external bypass breaker.
External Input Breaker	The status of the external input breaker.
Fuse Failure	A summary event indicating one or more fuse failures
Ground Fault	An AC phase to ground fault or three phase fault to ground exists on the output of the UPS.
Group Identifier	A runtime assigned group identification number
Hardware Mismatch	The assigned system model settings do not match the actual installed hardware. The module count is wrong, or a module of the wrong type is installed.
Inlet Air Temperature	The temperature of the inlet air
Input Breaker	Input breaker
Input Current Rating	The RMS current rating of input source on one phase
Input Source Backfeed	The battery is backfeeding the input source.
Input Source Switch	Type of Input Source Switch
Internal Bypass Breaker	Internal bypass breaker
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Inverter Failure	Inverter failure - inverter output is off
Inverter On/Off State	inverter on/off state
Inverter Relay Fault	The inverter relay has malfunctioned.
Inverter Shutdown - Overload	The inverter has shutdown due to a sustained overload
Inverter Status	Status of the inverter output. Active means the inverter is online with regulated output voltage and ready to power the load. Inactive means the inverter is offline and not ready to power the load.
LBS Active	The Load Bus Sync option is active
LBS Cable Failure	Load Bus Sync communications is abnormal. A problem with the LBS cable may exist.
LBS Inhibited	The system has detected that conditions to perform Load Bus Sync are not satisfied
Load Impact Transfer	On bypass as result of load impact.
Load on Bypass Union	The output power is supplied by the bypass and maintenance bypass.
Load Sharing Fault	Difference between any phase inverter current of unit and the relevant average output current of parallel system is more than a specific percent of nominal current.
Loss of Redundancy	The system has an insufficient number of power modules to provide redundancy.
Loss of Synchronization	The inverter and bypass are no longer synchronized.
Low Battery Warning Time	When battery time remaining falls to, or below, this value the low battery alarm is activated.
Mains Input Neutral Lost	Loss of neutral in the input source is detected.
Maintenance Bypass Breaker	Maintenance bypass breaker

Table 3.96 Liebert®APM 160—Glossary (continued)

Data Label	Data Description
MMS Capacity Exceeded	The critical load is larger than the redundant rating of a 1+N redundant multi-module system.
MMS Output Apparent Power	The sum total apparent power of all system output modules
MMS Output Power	The sum total power of all system output modules
MMS Overload	Multi-module system overload
MMS UPS Output Source	Multi-module UPS output source
Module Operating Status	The operating status for this Power Module.
Negative DC Bus Voltage	The voltage between the negative terminals of the DC bus and neutral line.
Number Of Active Power Modules	The total number of active power modules.
Number of Discharge Cycles	The total number of battery discharge cycles for the Battery Module since it was made.
Number of Installed Power Modules	The total number of Power Modules installed.
On Generator	A generator is supplying the power to the system
Output Breaker Open	UPS internal or external output breaker is open.
Output Breaker	Output breaker
Output Current Crest Factor Phs A	Output current crest factor of Phase A.
Output Current Crest Factor Phs B	Output current crest factor of Phase B.
Output Current Crest Factor Phs C	Output current crest factor of Phase C.
Output Load on Maint. Bypass	The output power is supplied by the maintenance bypass
Output Overload	An overload exists on the output.
Parallel Cable Failure	The UPS parallel system communications is abnormal. A problem with the parallel cable may exist.
Parallel Comm Warning	Parallel communication bus warning
Parameter Configuration Failed	Parameter configuration failed
Positive DC Bus Voltage	The voltage between the positive terminals of the DC bus and neutral line.
Power Module Balancer of DC Bus Failure	Balancer of DC Bus in the power module has failed
Power Module Bypass Input Frequency	The bypass input frequency detected by power module
Power Module Bypass Input Voltage RMS A-B	The bypass input RMS voltage between phases A and B detected by power module
Power Module Bypass Input Voltage RMS A-N	The bypass input RMS voltage between phase A and Neutral detected by power module

Table 3.96 Liebert®APM 160—Glossary (continued)

Data Label	Data Description
Power Module Bypass Input Voltage RMS B-C	The bypass input RMS voltage between phases B and C detected by power module
Power Module Bypass Input Voltage RMS B-N	The bypass input RMS voltage between phase B and Neutral detected by power module
Power Module Bypass Input Voltage RMS C-A	The bypass input RMS voltage between phases C and A detected by power module
Power Module Bypass Input Voltage RMS C-N	The bypass input RMS voltage between phase C and Neutral detected by power module
Power Module Communication status	The control has detected a power module communication failure.
Power Module Fan Fault	The Power Module has detected a fan fault.
Power Module Fuse Failure	A summary event indicating one or more fuse failures in the power module
Power Module Input Current Abnormal	Input current of the power module is abnormal
Power Module Input Current High	Input current of the power module is over limit.
Power Module Lever Unlocked	The power module is inactive because the lever is in the unlocked position.
Power Module Over Temperature	The Power Module has detected an over temperature condition.
Power Module Power Supply Failure	Power module power supply failure
Power Module Ready Status	Status of the inverter. Active means the inverter is ready to power the load. Inactive means the inverter is not ready to power the load.
Power Module Sleep Status	Sleep status of the Power module
Rectifier Failure	Rectifier failure - rectifier is off
SPM Board Not Ready	The Server Power Management sample board is not ready.
SPM CRC Check Error	Server Power Management CRC Check Error
SPM Internal Comm Failure	The communication with Server Power Management is lost.
System Capacity	System capacity supported by the installed power modules.
System Date and Time	The system date and time
System Fan Failure	System fan failure - one or more fans have failed
System Input Apparent Power Phs A	The system apparent power on phase A
System Input Apparent Power Phs B	The system apparent power on phase B
System Input Apparent Power Phs C	The system apparent power on phase C
System Input Black Out Count	The number of occurrences, since the last reset, where the input was not qualified to provide power to the system

Table 3.96 Liebert®APM 160—Glossary (continued)

Data Label	Data Description
System Input Brown Out Count	The number of occurrences, since the last reset, where the system input voltage has fallen below a pre-determined threshold for a specified amount of time
System Input Frequency	The system input frequency
System Input Nominal Current	The nominal (or rated) system input current
System Input Nominal Voltage	The nominal (or rated) system input voltage
System Input Phs Rotation Error	The power conductors on the input line are not wired to the UPS in the sequence preferred for the rectifier (A-B-C)
System Input Power Factor Phs A	The system input power factor for Phase A
System Input Power Factor Phs B	The system input power factor for Phase B
System Input Power Factor Phs C	The system input power factor for Phase C
System Input Power Phase A	The system input power on phase A
System Input Power Phase B	The system input power on phase B
System Input Power Phase C	The system input power on phase C
System Input Power Problem	The input is not qualified to provide power to the system
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Input RMS Current Phase A	The system input RMS current for Phase A
System Input RMS Current Phase B	The system input RMS current for Phase B
System Input RMS Current Phase C	The system input RMS current for Phase C
System Output Apparent Power Phs A	System output apparent power on phase A
System Output Apparent Power Phs B	System output apparent power on phase B
System Output Apparent Power Phs C	System output apparent power on phase C
System Output Apparent Power	The sum total apparent power of all system output phases
System Output Fault	A fault has been detected in the system output

Table 3.96 Liebert®APM 160—Glossary (continued)

Data Label	Data Description
System Output Frequency	The system output frequency
System Output Nominal Frequency	The nominal (or rated) system output frequency
System Output Nominal Voltage	The nominal (or rated) system output voltage
System Output Off	The system output is off
System Output Pct Power Phase A	The system output power on phase A as a percentage of the rated capacity
System Output Pct Power Phase B	The system output power on phase B as a percentage of the rated capacity
System Output Pct Power Phase C	The system output power on phase C as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs A	The system output apparent power on phase A as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs B	The system output apparent power on phase B as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs C	The system output apparent power on phase C as a percentage of the rated capacity
System Output Power Factor Phs A	The system output power factor of phase A
System Output Power Factor Phs B	The system output power factor of phase B
System Output Power Factor Phs C	The system output power factor of phase C
System Output Power Phase A	The system output power on phase A.
System Output Power Phase B	The system output power on phase B.
System Output Power Phase C	The system output power on phase C.
System Output Power	The sum total power of all system output phases
System Output RMS Current Phs A	The system output RMS current for Phase A
System Output RMS Current Phs B	The system output RMS current for Phase B
System Output RMS Current Phs C	The system output RMS current for Phase C
System Output Voltage RMS A-B	The system output RMS voltage between phases A and B
System Output Voltage RMS A-N	The system output RMS voltage between phases A and Neutral

Table 3.96 Liebert®APM 160—Glossary (continued)

Data Label	Data Description
System Output Voltage RMS B-C	The system output RMS voltage between phases B and C
System Output Voltage RMS B-N	The system output RMS voltage between phases B and Neutral
System Output Voltage RMS C-A	The system output RMS voltage between phases C and A
System Output Voltage RMS C-N	The system output RMS voltage between phases C and Neutral
System Set To Operate With	If this point reports 'Redundancy' then the system is configured for redundancy and the 'Loss of Redundancy' alarm is enabled.
System Shutdown - EPO	System shutdown due to Emergency Power Off (EPO)
System Status	The operating status for the system
Time Until Next Auto Battery Test	The time until the next automatic battery test is started.
Total Input Active Power Phase A	The active power of the input source on Phase A.
Total Input Active Power Phase B	The active power of the input source on Phase B.
Total Input Active Power Phase C	The active power of the input source on Phase C.
Total Input Apparent Power Phase A	Total Input Apparent Power Phase A
Total Input Apparent Power Phase B	Total Input Apparent Power Phase B
Total Input Apparent Power Phase C	Total Input Apparent Power Phase C
Total Input Breaker Status	The status of total input breaker
Total Input Current Load Phase A	The percentage of RMS current to the rated capacity of Phase A.
Total Input Current Load Phase B	The percentage of RMS current to the rated capacity of Phase B.
Total Input Current Load Phase C	The percentage of RMS current to the rated capacity of Phase C.
Total Input Energy Phase A	The total accumulated energy for Phase A since the last reset.
Total Input Energy Phase B	The total accumulated energy for Phase B since the last reset.
Total Input Energy Phase C	The total accumulated energy for Phase C since the last reset.
Total Input Frequency	The input source phase frequency
Total Input Power Factor Phase A	The ratio of real to apparent power for input source Phase A.

Table 3.96 Liebert®APM 160—Glossary (continued)

Data Label	Data Description
Total Input Power Factor Phase B	The ratio of real to apparent power for input source Phase B.
Total Input Power Factor Phase C	The ratio of real to apparent power for input source Phase C.
Total Input RMS Current Phase A	The RMS current for input source phase A
Total Input RMS Current Phase B	The RMS current for input source phase B
Total Input RMS Current Phase C	The RMS current for input source phase C
Total Input THDI Phase A	Total Input THDI Phase A
Total Input THDI Phase B	Total Input THDI Phase B
Total Input THDI Phase C	Total Input THDI Phase C
Total Input THDU Phase A	The input source Phase A THDU.
Total Input THDU Phase B	The input source Phase B THDU.
Total Input THDU Phase C	The input source Phase C THDU.
Total Input Voltage Phase A	The voltage of input source Phase A.
Total Input Voltage Phase B	The voltage of input source Phase B.
Total Input Voltage Phase C	The voltage of input source Phase C.
Total System Operating Time	The cumulative operation time of the unit
Transfer to Bypass - System Overload	The UPS System has transferred to bypass because the active power modules cannot support the critical load.
UPS Battery Status	UPS battery status
UPS Output on Bypass	The output power is supplied by the bypass
UPS Output Source	UPS output source
User Operation Invalid	User attempted an invalid operation.

Table 3.97 Liebert® APM 600—Status and Coil

Data Label	Status	Coil	Number of Bits	Notes
Input				
Mains Input Neutral Lost	10001	—	1	Active on Alarm
System Input Phs Rotation Error	10002	—	1	Active on Alarm
System Input Power Problem	10003	—	1	Active on Alarm
Input Source Backfeed	10004	—	1	Active on Alarm
Bypass

If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.					

Table 3.99 Liebert® APM 600—Glossary

Data Label	Data Description
(Deprecated) UPS Application Mode	(Deprecated) UPS application mode. This data point has been replaced and should no longer be used.
Accumulated Discharge Time	Total accumulated discharge time for the Battery Module since it was made.
Application Mode For UPS	Application Mode for UPS.
Automatic Battery Test	Enable/disable the automatic battery test schedule.
Average system efficiency	Average system efficiency
Battery Auto Test In Progress	Automatic battery test is in progress
Battery Breaker 1 Open Failure	Battery circuit breaker 1 failed to open
Battery Breaker 2 Open Failure	Battery circuit breaker 2 failed to open
Battery Breaker 3 Open Failure	Battery circuit breaker 3 failed to open
Battery Breaker 4 Open Failure	Battery circuit breaker 4 failed to open
Battery Breaker Open Failure	Battery circuit breaker failed to open
Battery Capacity Low	Battery capacity is low
Battery Charge Equalization Timeout	The battery equalizing is time out.
Battery charge status.	Battery charge status.
Battery Charging Error	The battery is not charging properly
Battery Charging Inhibited	Battery charging is inhibited due to an external inhibit signal
Battery Circuit Breaker 1 Open	Battery circuit breaker 1 is open
Battery Circuit Breaker 2 Open	Battery circuit breaker 2 is open
Battery Circuit Breaker 3 Open	Battery circuit breaker 3 is open
Battery Circuit Breaker 4 Open	Battery circuit breaker 4 is open
Battery Circuit Breaker Open	Battery circuit breaker is open
Battery Converter Current Limit	The battery converter has reached its maximum current limit.
Battery Converter Failure	Battery converter failure. This is a summary event caused by one or more power sub-modules in a UPS module.
Battery Discharging	The battery is discharging
Battery Equalize	The rectifier output voltage is increased to equalize the battery voltage level.
Battery Ground Fault	Battery system ground fault amperage exceeds the threshold
Battery Low	The calculated battery time remaining has reached the low battery threshold
Battery Manual Test In Progress	Manual battery test is in progress
Battery Not Qualified	The UPS battery voltage is not qualified. This event will be detected even in the absence of battery disconnect or when it is open.
Battery Over Temperature	A battery temperature sensor is reporting a value above a threshold
Battery Percentage Charge	The percentage of battery charge

Table 3.99 Liebert® APM 600—Glossary (continued)

Data Label	Data Description
Battery Room Alarm	The ambient temperature of the battery room is abnormal.
Battery Self Test Cycle Time	The time between automatic battery self test cycles.
Battery Self Test	Battery self test is in progress
Battery Temperature for Cabinet	The battery temperature for a cabinet
Battery Temperature	The highest battery temperature among all Battery Cabinets
Battery Terminals Reversed	The measured battery voltage is a negative value due to reverse battery terminal connections.
Battery Test Failed	Battery test failed
Battery Test Passed	Battery test passed
Battery Time Remaining	The calculated available time on battery
Battery Volts for Cabinet	The voltage between the positive and negative battery terminals of a battery cabinet
Bypass - Excess Auto Retransfers	The number of auto retransfers, from bypass to inverter, has exceeded the maximum for a specified time interval
Bypass Apparent Power Phase A	The bypass apparent power on phase A
Bypass Apparent Power Phase B	The bypass apparent power on phase B
Bypass Apparent Power Phase C	The bypass apparent power on phase C
Bypass Backfeed Detected	The system detected a voltage on the bypass when none was expected
Bypass Input Frequency	The bypass input frequency
Bypass Input Voltage Fault	The system has detected the bypass voltage is unqualified.
Bypass Input Voltage RMS A-B	The bypass input RMS voltage between phases A and B
Bypass Input Voltage RMS A-N	The bypass input RMS voltage between phase A and Neutral
Bypass Input Voltage RMS B-C	The bypass input RMS voltage between phases B and C
Bypass Input Voltage RMS B-N	The bypass input RMS voltage between phase B and Neutral
Bypass Input Voltage RMS C-A	The bypass input RMS voltage between phases C and A
Bypass Input Voltage RMS C-N	The bypass input RMS voltage between phase C and Neutral
Bypass Nominal Voltage	Bypass nominal (or rated) voltage
Bypass Not Available	A problem associated with the bypass has been detected
Bypass Power Phase A	The bypass power on phase A
Bypass Power Phase B	The bypass power on phase B
Bypass Power Phase C	The bypass power on phase C
Bypass Static Switch Unavailable	The static bypass is unavailable to support the critical load.
DC Bus Abnormal	The system has detected an abnormal DC Bus Voltage.
DC Bus Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value

Table 3.99 Liebert® APM 600—Glossary (continued)

Data Label	Data Description
DC Bus Voltage	The voltage between the positive and negative terminals of the DC bus at the battery input
ECO Mode Operation State	This setting is used to enable or disable ECO Mode.
ECO Suspended Time Remaining	The time remaining before ECO mode is activated.
Equipment Over Temperature	Equipment over temperature summary event
Excess ECO Suspends	Number of automatic suspensions has exceeded the ECO Mode - Maximum Auto Suspensions setting.
External Bypass Breaker	The status of the external bypass breaker.
Fuse Failure	A summary event indicating one or more fuse failures
Hardware Mismatch	The assigned system model settings do not match the actual installed hardware. The module count is wrong, or a module of the wrong type is installed.
Inlet Air Temperature	The temperature of the inlet air
Input Breaker	Input breaker
Input Source Backfeed	The battery is backfeeding the input source.
Intelligent Parallel Operation State	This setting is used to enable or disable Intelligent Paralleling.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Inverter Failure	Inverter failure - inverter output is off
Inverter On/Off State	inverter on/off state
Inverter Relay Fault	The inverter relay has malfunctioned.
Inverter Shutdown - Overload	The inverter has shutdown due to a sustained overload
Inverter Status	Status of the inverter output. Active means the inverter is online with regulated output voltage and ready to power the load. Inactive means the inverter is offline and not ready to power the load.
LBS Active	The Load Bus Sync option is active
LBS Cable Failure	Load Bus Sync communications is abnormal. A problem with the LBS cable may exist.
LBS Inhibited	The system has detected that conditions to perform Load Bus Sync are not satisfied
Lithium-Ion Battery System Abnormal	Lithium-Ion Battery System Abnormal
Lithium-Ion Battery System Communication Abnormal	Lithium-Ion Battery System Communication Abnormal
Lithium-Ion Battery System Disconnect Request	A request to disconnect the Lithium-Ion battery system was received.
Lithium-Ion Battery System Fault	The Lithium-Ion Battery system has one or more faults.
Lithium-Ion Battery System Status	Lithium-Ion Battery System Status

Table 3.99 Liebert® APM 600—Glossary (continued)

Data Label	Data Description
Lithium-Ion Battery System Warning	The Lithium-Ion Battery system has one or more warnings.
Load Impact Transfer	On bypass as result of load impact.
Load Sharing Fault	Difference between any phase inverter current of unit and the relevant average output current of parallel system is more than a specific percent of nominal current.
Loss of Redundancy	The system has an insufficient number of power modules to provide redundancy.
Loss of Synchronization	The inverter and bypass are no longer synchronized.
Low Battery Warning Time	When battery time remaining falls to, or below, this value the low battery alarm is activated.
Main Battery Disconnect Open	Main battery disconnect is open
Mains Input Neutral Lost	Loss of neutral in the input source is detected.
Maintenance Bypass Breaker	Maintenance bypass breaker
MMS Capacity Exceeded	The critical load is larger than the redundant rating of a 1+N redundant multi-module system.
MMS Output Apparent Power	The sum total apparent power of all system output modules
MMS Output Power	The sum total power of all system output modules
MMS Overload	Multi-module system overload
MMS UPS Output Source	Multi-module UPS output source
Module Operating Status	The operating status for this Power Module.
Negative DC Bus Voltage	The voltage between the negative terminals of the DC bus and neutral line.
Number Of Active Power Modules	The total number of active power modules.
Number of Discharge Cycles	The total number of battery discharge cycles for the Battery Module since it was made.
Number of Installed Power Modules	The total number of Power Modules installed.
On Generator	A generator is supplying the power to the system
Output Breaker	Output breaker
Output Current Crest Factor Phs A	Output current crest factor of Phase A.
Output Current Crest Factor Phs B	Output current crest factor of Phase B.
Output Current Crest Factor Phs C	Output current crest factor of Phase C.
Output Load on Maint. Bypass	The output power is supplied by the maintenance bypass
Output Overload	An overload exists on the output.
Parallel Cable Failure	The UPS parallel system communications is abnormal. A problem with the parallel cable may exist.
Parallel Comm Warning	Parallel communication bus warning

Table 3.99 Liebert® APM 600—Glossary (continued)

Data Label	Data Description
Positive DC Bus Voltage	The voltage between the positive terminals of the DC bus and neutral line.
Power Module Balancer of DC Bus Failure	Balancer of DC Bus in the power module has failed
Power Module Bypass Input Frequency	The bypass input frequency detected by power module
Power Module Bypass Input Voltage RMS A-B	The bypass input RMS voltage between phases A and B detected by power module
Power Module Bypass Input Voltage RMS A-N	The bypass input RMS voltage between phase A and Neutral detected by power module
Power Module Bypass Input Voltage RMS B-C	The bypass input RMS voltage between phases B and C detected by power module
Power Module Bypass Input Voltage RMS B-N	The bypass input RMS voltage between phase B and Neutral detected by power module
Power Module Bypass Input Voltage RMS C-A	The bypass input RMS voltage between phases C and A detected by power module
Power Module Bypass Input Voltage RMS C-N	The bypass input RMS voltage between phase C and Neutral detected by power module
Power Module Communication status	The control has detected a power module communication failure.
Power Module Fan Fault	The Power Module has detected a fan fault.
Power Module Fuse Failure	A summary event indicating one or more fuse failures in the power module
Power Module Input Current Abnormal	Input current of the power module is abnormal
Power Module Lever Unlocked	The power module is inactive because the lever is in the unlocked position.
Power Module Over Temperature	The Power Module has detected an over temperature condition.
Power Module Power Supply Failure	Power module power supply failure
Power Module Ready Status	Status of the inverter. Active means the inverter is ready to power the load. Inactive means the inverter is not ready to power the load.
Power Module Sleep Status	Sleep status of the Power module
Rectifier Failure	Rectifier failure - rectifier is off
System Capacity	System capacity supported by the installed power modules.
System Date and Time	The system date and time
System Input Apparent Power Phs A	The system apparent power on phase A
System Input Apparent Power Phs B	The system apparent power on phase B

Table 3.99 Liebert® APM 600—Glossary (continued)

Data Label	Data Description
System Input Apparent Power Phs C	The system apparent power on phase C
System Input Black Out Count	The number of occurrences, since the last reset, where the input was not qualified to provide power to the system
System Input Brown Out Count	The number of occurrences, since the last reset, where the system input voltage has fallen below a pre-determined threshold for a specified amount of time
System Input Frequency	The system input frequency
System Input Nominal Current	The nominal (or rated) system input current
System Input Nominal Frequency	The nominal (or rated) system input frequency
System Input Nominal Voltage	The nominal (or rated) system input voltage
System Input Phs Rotation Error	The power conductors on the input line are not wired to the UPS in the sequence preferred for the rectifier (A-B-C)
System Input Power Factor Phs A	The system input power factor for Phase A
System Input Power Factor Phs B	The system input power factor for Phase B
System Input Power Factor Phs C	The system input power factor for Phase C
System Input Power Phase A	The system input power on phase A
System Input Power Phase B	The system input power on phase B
System Input Power Phase C	The system input power on phase C
System Input Power Problem	The input is not qualified to provide power to the system
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Input RMS Current Phase A	The system input RMS current for Phase A
System Input RMS Current Phase B	The system input RMS current for Phase B
System Input RMS Current Phase C	The system input RMS current for Phase C
System Output Apparent Power Phs A	System output apparent power on phase A
System Output Apparent Power Phs B	System output apparent power on phase B

Table 3.99 Liebert® APM 600—Glossary (continued)

Data Label	Data Description
System Output Apparent Power Phs C	System output apparent power on phase C
System Output Apparent Power	The sum total apparent power of all system output phases
System Output Fault	A fault has been detected in the system output
System Output Frequency	The system output frequency
System Output Nominal Frequency	The nominal (or rated) system output frequency
System Output Nominal Voltage	The nominal (or rated) system output voltage
System Output Off	The system output is off
System Output Pct Power Phase A	The system output power on phase A as a percentage of the rated capacity
System Output Pct Power Phase B	The system output power on phase B as a percentage of the rated capacity
System Output Pct Power Phase C	The system output power on phase C as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs A	The system output apparent power on phase A as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs B	The system output apparent power on phase B as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs C	The system output apparent power on phase C as a percentage of the rated capacity
System Output Power Factor Phs A	The system output power factor of phase A
System Output Power Factor Phs B	The system output power factor of phase B
System Output Power Factor Phs C	The system output power factor of phase C
System Output Power Phase A	The system output power on phase A.
System Output Power Phase B	The system output power on phase B.
System Output Power Phase C	The system output power on phase C.
System Output Power	The sum total power of all system output phases
System Output RMS Current Phs A	The system output RMS current for Phase A
System Output RMS Current Phs B	The system output RMS current for Phase B
System Output RMS Current Phs C	The system output RMS current for Phase C
System Output Voltage RMS A-B	The system output RMS voltage between phases A and B

Table 3.99 Liebert® APM 600—Glossary (continued)

Data Label	Data Description
System Output Voltage RMS A-N	The system output RMS voltage between phases A and Neutral
System Output Voltage RMS B-C	The system output RMS voltage between phases B and C
System Output Voltage RMS B-N	The system output RMS voltage between phases B and Neutral
System Output Voltage RMS C-A	The system output RMS voltage between phases C and A
System Output Voltage RMS C-N	The system output RMS voltage between phases C and Neutral
System Set To Operate With	If this point reports 'Redundancy' then the system is configured for redundancy and the 'Loss of Redundancy' alarm is enabled.
System Shutdown - EPO	System shutdown due to Emergency Power Off (EPO)
System Status	The operating status for the system
Time Until Next Auto Battery Test	The time until the next automatic battery test is started.
Top Outlet Fan Fault	Top outlet fan fault - one or more top outlet fans have failed.
Total System Operating Time	The cumulative operation time of the unit
Transfer to Bypass - System Overload	The UPS System has transferred to bypass because the active power modules cannot support the critical load.
UPS Battery Status	UPS battery status
UPS Output on Bypass	The output power is supplied by the bypass
UPS Output Source	UPS output source
User Operation Invalid	User attempted an invalid operation.

Table 3.100 Liebert® APM2—Status and Coil

Data Label	Status	Coil	Number of Bits	Notes
Input				
Mains Input Neutral Lost	10001	—	1	Active on Alarm
System Input Phs Rotation Error	10002	—	1	Active on Alarm

System Configuration					
System Date and Time	39998	49998	2	—	Units : Secs since Epoch(UTC)

Table 3.102 Liebert® APM2—Glossary

Data Label	Data Description
Accumulated Discharge Time	Total accumulated discharge time for the Battery Module since it was made.
Application Mode For UPS	Application Mode for UPS.
Automatic Battery Test	Enable/disable the automatic battery test schedule.
Average system efficiency	Average system efficiency
Backfeed Breaker Open	The backfeed breaker is in the open position
Battery Auto Test In Progress	Automatic battery test is in progress

Table 3.102 Liebert® APM2—Glossary (continued)

Data Label	Data Description
Battery Breaker 1 Open Failure	Battery circuit breaker 1 failed to open
Battery Breaker 10 Open Failure	Battery circuit breaker 10 failed to open
Battery Breaker 11 Open Failure	Battery circuit breaker 11 failed to open
Battery Breaker 12 Open Failure	Battery circuit breaker 12 failed to open
Battery Breaker 2 Open Failure	Battery circuit breaker 2 failed to open
Battery Breaker 3 Open Failure	Battery circuit breaker 3 failed to open
Battery Breaker 4 Open Failure	Battery circuit breaker 4 failed to open
Battery Breaker 5 Open Failure	Battery circuit breaker 5 failed to open
Battery Breaker 6 Open Failure	Battery circuit breaker 6 failed to open
Battery Breaker 7 Open Failure	Battery circuit breaker 7 failed to open
Battery Breaker 8 Open Failure	Battery circuit breaker 8 failed to open
Battery Breaker 9 Open Failure	Battery circuit breaker 9 failed to open
Battery Cabinet Capacity	The percentage of battery charge of a battery cabinet
Battery Cabinet Charge Disconnect Status	The charge disconnected status of a battery cabinet
Battery Cabinet Charge Over Current	Battery Cabinet Charge over current
Battery Cabinet Circuit Breaker Status	Battery cabinet circuit breaker status
Battery Cabinet Discharge Disconnect Status	The discharge disconnected status of a battery cabinet
Battery Cabinet Discharge Over Current	Battery Cabinet Discharge over current
Battery Cabinet High Cell Voltage	The system has detected a high cell voltage condition.
Battery Cabinet High Overall Voltage	The system has detected a high battery cabinet overall voltage condition.
Battery Cabinet Highest Cell Temperature	Battery cabinet highest cell temperature

Table 3.102 Liebert® APM2—Glossary (continued)

Data Label	Data Description
Battery Cabinet Low Cell Voltage	The system has detected a low cell voltage condition.
Battery Cabinet Low Overall Voltage	The system has detected a low battery cabinet overall voltage condition.
Battery Cabinet Lowest Cell Temperature	Battery cabinet lowest cell temperature
Battery Cabinet Max Cell Voltage	Battery cabinet max cell voltage
Battery Cabinet Min Cell Voltage	Battery cabinet min cell voltage
Battery Cabinet Operating Status	The operating status for this Battery Cabinet.
Battery Cabinet Over Cell Voltage	The system has detected a battery cabinet over cell voltage condition.
Battery Cabinet Over Overall Voltage	The system has detected a battery cabinet over overall voltage condition.
Battery Cabinet Over Temperature	The system has detected a battery cabinet over temperature condition.
Battery Cabinet Type	The type of Battery Cabinet: Internal or External
Battery Cabinet Under Cell Voltage	The system has detected a battery cabinet under cell voltage condition.
Battery Cabinet Under Overall Voltage	The system has detected a battery cabinet under overall voltage condition.
Battery Cabinet Under Temperature	The system has detected a battery cabinet under temperature condition.
Battery Cell Temperature	Temperature reading of a Cell within a battery module.
Battery Cell Voltage	Voltage reading of a Cell within a battery module.
Battery Charge Equalization Timeout	The battery equalizing is time out.
Battery Charging Inhibited	Battery charging is inhibited due to an external inhibit signal
Battery Circuit Breaker 1 Open	Battery circuit breaker 1 is open
Battery Circuit Breaker 10 Open	Battery circuit breaker 10 is open
Battery Circuit Breaker 11 Open	Battery circuit breaker 11 is open
Battery Circuit Breaker 12 Open	Battery circuit breaker 12 is open
Battery Circuit Breaker 2 Open	Battery circuit breaker 2 is open

Table 3.102 Liebert® APM2—Glossary (continued)

Data Label	Data Description
Battery Circuit Breaker 3 Open	Battery circuit breaker 3 is open
Battery Circuit Breaker 4 Open	Battery circuit breaker 4 is open
Battery Circuit Breaker 5 Open	Battery circuit breaker 5 is open
Battery Circuit Breaker 6 Open	Battery circuit breaker 6 is open
Battery Circuit Breaker 7 Open	Battery circuit breaker 7 is open
Battery Circuit Breaker 8 Open	Battery circuit breaker 8 is open
Battery Circuit Breaker 9 Open	Battery circuit breaker 9 is open
Battery Converter Current Limit	The battery converter has reached its maximum current limit.
Battery Current for Cabinet	The current between the positive and negative battery terminals of a battery cabinet
Battery Discharging	The battery is discharging
Battery Equalize	The rectifier output voltage is increased to equalize the battery voltage level.
Battery Ground Fault	Battery system ground fault amperage exceeds the threshold
Battery is	Battery charge status.
Battery Low	The calculated battery time remaining has reached the low battery threshold
Battery Manual Test In Progress	Manual battery test is in progress
Battery Module Charge Over Current	Battery Module Charge over current
Battery Module Current	Battery Module Current
Battery Module Discharge Over Current	Battery Module Discharge over current
Battery Module Disconnect Status	Battery Module Disconnect Status
Battery Module Disconnected	Battery Module is disconnected
Battery Module Fault	Battery module fault
Battery Module High Cell Voltage	The system has detected a high cell voltage condition.
Battery Module High Overall Voltage	The system has detected a high battery module overall voltage condition.

Table 3.102 Liebert® APM2—Glossary (continued)

Data Label	Data Description
Battery Module Highest Cell Temperature	Battery module highest cell temperature
Battery Module Low Cell Voltage	The system has detected a low cell voltage condition.
Battery Module Low Overall Voltage	The system has detected a low battery module overall voltage condition.
Battery Module Lowest Cell Temperature	Battery module lowest cell temperature
Battery Module Max Cell Voltage	Battery module max cell voltage
Battery Module Min Cell Voltage	Battery module min cell voltage
Battery Module Over Cell Voltage	The system has detected a battery module over cell voltage condition.
Battery Module Over Overall Voltage	The system has detected a battery module over overall voltage condition.
Battery Module Over Temperature	The system has detected a battery module over temperature condition.
Battery Module State Of Charge	Battery Module State Of Charge
Battery Module Temperature	The battery temperature measured by the Battery Module.
Battery Module Under Cell Voltage	The system has detected a battery module under cell voltage condition.
Battery Module Under Overall Voltage	The system has detected a battery module under overall voltage condition.
Battery Module Under Temperature	The system has detected a battery module under temperature condition.
Battery Module Voltage	Battery Module Voltage
Battery Not Qualified	The UPS battery voltage is not qualified. This event will be detected even in the absence of battery disconnect or when it is open.
Battery Percentage Charge	The percentage of battery charge
Battery Room Alarm	The ambient temperature of the battery room is abnormal.
Battery Self Test Cycle Time	The time between automatic battery self test cycles.
Battery Self Test	Battery self test is in progress
Battery System Communication Abnormal	Battery System Communication Abnormal
Battery System Fault	Battery System Fault
Battery System Warning	Battery System Warning

Table 3.102 Liebert® APM2—Glossary (continued)

Data Label	Data Description
Battery Temperature for Cabinet	The battery temperature for a cabinet
Battery Temperature Sensor Fault	A battery temperature sensor fault has been detected
Battery Temperature	Battery Temperature
Battery Terminal Abnormal	Battery Terminal Abnormal
Battery Terminals Reversed	The measured battery voltage is a negative value due to reverse battery terminal connections.
Battery Test Failed	Battery test failed
Battery Time Remaining	The calculated available time on battery
Battery type	Battery type of the UPS system
Battery Volts for Cabinet	The voltage between the positive and negative battery terminals of a battery cabinet
Bypass - Excess Auto Retransfers	The number of auto retransfers, from bypass to inverter, has exceeded the maximum for a specified time interval
Bypass Apparent Power Phase A	The bypass apparent power on phase A
Bypass Apparent Power Phase B	The bypass apparent power on phase B
Bypass Apparent Power Phase C	The bypass apparent power on phase C
Bypass Backfeed Detected	The system detected a voltage on the bypass when none was expected
Bypass controlling the SCR autonomously	The bypass is controlling the SCR autonomously because not all inverters are online.
Bypass Input Frequency	The bypass input frequency
Bypass Input Voltage Fault	The system has detected the bypass voltage is unqualified.
Bypass Input Voltage RMS A-B	The bypass input RMS voltage between phases A and B
Bypass Input Voltage RMS A-N	The bypass input RMS voltage between phase A and Neutral
Bypass Input Voltage RMS B-C	The bypass input RMS voltage between phases B and C
Bypass Input Voltage RMS B-N	The bypass input RMS voltage between phase B and Neutral
Bypass Input Voltage RMS C-A	The bypass input RMS voltage between phases C and A
Bypass Input Voltage RMS C-N	The bypass input RMS voltage between phase C and Neutral
Bypass Isolation Breaker	Bypass isolation breaker

Table 3.102 Liebert® APM2—Glossary (continued)

Data Label	Data Description
Bypass Module Communication Fault	The bypass module communication failure.
Bypass Module Fan Fault	The Bypass Module has detected a fan fault.
Bypass Module Not Ready	Bypass Module is not ready
Bypass Module Operating Status	The operating status for this Bypass Module.
Bypass Module Over Temperature	The Bypass Module has detected an over temperature condition.
Bypass Module Power Supply Failure	Bypass module power supply failure
Bypass Nominal Voltage	Bypass nominal (or rated) voltage
Bypass out of sync	Bypass and Inverter inputs are not in sync
Bypass Power Phase A	The bypass power on phase A
Bypass Power Phase B	The bypass power on phase B
Bypass Power Phase C	The bypass power on phase C
Bypass Static Switch Unavailable	The static bypass is unavailable to support the critical load.
Cell Temperature	Temperature reading of a Cell within a BAM device.
Cell Voltage	Voltage reading of a Cell within a BAM device.
Charger Failure	Charger Failure - Charger is off
Charger On/Off State	Charger on/off state
DC Bus Abnormal	The system has detected an abnormal DC Bus Voltage.
DC Bus Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value
DC Bus Voltage	The voltage between the positive and negative terminals of the DC bus at the battery input
Discharger Failure	Discharger failure
Discharger On/Off Status	Discharger on/off status
Discharger Shutdown	A condition is present that prevents the Battery Discharger from working.
ECO mode Inhibited	ECO mode is inhibited due to an external inhibit signal.
ECO Suspended Time Remaining	The time remaining before ECO mode is activated.
Equipment Over Temperature	Equipment over temperature summary event
Excess ECO Suspends	Number of automatic suspensions has exceeded the ECO Mode - Maximum Auto Suspensions setting.
External Battery Cabinet Count	The battery cabinet count

Table 3.102 Liebert® APM2—Glossary (continued)

Data Label	Data Description
Fuse Failure	A summary event indicating one or more fuse failures
Ground Fault	An AC phase to ground fault or three phase fault to ground exists on the output of the UPS.
Hardware Mismatch	The assigned system model settings do not match the actual installed hardware. The module count is wrong, or a module of the wrong type is installed.
Inlet Air Temperature	The temperature of the inlet air
Input Source Backfeed	The battery is backfeeding the input source.
Input Under Voltage	Input under voltage.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Internal Resistance Value	The measured internal resistance of a cell.
Inverter Failure	Inverter failure - inverter output is off
Inverter On/Off State	inverter on/off state
Inverter Relay Fault	The inverter relay has malfunctioned.
Inverter Shutdown - Overload	The inverter has shutdown due to a sustained overload
Inverter Status	Status of the inverter output. Active means the inverter is online with regulated output voltage and ready to power the load. Inactive means the inverter is offline and not ready to power the load.
Inverter Transfer Inhibit - Ext	Transfer of critical bus source to inverter is inhibited by an external signal
LBS Active	The Load Bus Sync option is active
LBS Cable Failure	Load Bus Sync communications is abnormal. A problem with the LBS cable may exist.
LBS Inhibited	The system has detected that conditions to perform Load Bus Sync are not satisfied
Load Impact Transfer	On bypass as result of load impact.
Load Sharing Fault	Difference between any phase inverter current of unit and the relevant average output current of parallel system is more than a specific percent of nominal current.
Loss of Redundancy	The system has an insufficient number of power modules to provide redundancy.
Loss of Synchronization	The inverter and bypass are no longer synchronized.
Low Battery Warning Time	When battery time remaining falls to, or below, this value the low battery alarm is activated.
Mains Input Neutral Lost	Loss of neutral in the input source is detected.
Maintenance Bypass Breaker Closed	The maintenance bypass breaker is closed.
Maintenance Bypass Breaker	Maintenance bypass breaker
Maintenance Isolation Breaker	Maintenance isolation breaker
MMS Capacity Exceeded	The critical load is larger than the redundant rating of a 1+N redundant multi-module system.

Table 3.102 Liebert® APM2—Glossary (continued)

Data Label	Data Description
MMS Output Apparent Power	The sum total apparent power of all system output modules
MMS Output Power	The sum total power of all system output modules
MMS UPS Loading Status	Multi-module UPS loading status
Module Operating Status	The operating status for this Battery Module.
Module Operating Status	The operating status for this Power Module.
Module Output Breaker Open	The module output breaker is open.
Module Output Breaker	Module output breaker
Negative DC Bus Voltage	The voltage between the negative terminals of the DC bus and neutral line.
Number of Discharge Cycles	The total number of battery discharge cycles for the Battery Module since it was made.
On Generator	A generator is supplying the power to the system
Output Current Crest Factor Phs A	Output current crest factor of Phase A.
Output Current Crest Factor Phs B	Output current crest factor of Phase B.
Output Current Crest Factor Phs C	Output current crest factor of Phase C.
Output Disabled	Output Disabled
Output Load on Maint. Bypass	The output power is supplied by the maintenance bypass
Output Overload	An overload exists on the output.
Parallel Cable Failure	The UPS parallel system communications is abnormal. A problem with the parallel cable may exist.
Parallel Comm Warning	Parallel communication bus warning
Parameter Configuration Failed	Parameter configuration failed
Positive DC Bus Voltage	The voltage between the positive terminals of the DC bus and neutral line.
Power Module Balancer of DC Bus Failure	Balancer of DC Bus in the power module has failed
Power Module Communication status	The control has detected a power module communication failure.
Power Module Fan Fault	The Power Module has detected a fan fault.
Power Module Fuse Failure	A summary event indicating one or more fuse failures in the power module
Power Module Input Current Abnormal	Input current of the power module is abnormal

Table 3.102 Liebert® APM2—Glossary (continued)

Data Label	Data Description
Power Module Input Current High	Input current of the power module is over limit.
Power Module Not Ready	Power module not ready
Power Module Over Temperature	The Power Module has detected an over temperature condition.
Power Module Power Supply Failure	Power module power supply failure
Power Module Sleep Status	Sleep status of the Power module
Rectifier Failure	Rectifier failure - rectifier is off
Rectifier Isolation Breaker	Rectifier isolation breaker
Rectifier Status	rectifier status
Replace Battery	The battery is due for replacement.
Static Bypass Switch	Static Bypass Switch state - On/Off
System Bypass Phase Rotation Error	The power conductors on the input line are not wired to the UPS in the sequence preferred for the bypass (A-B-C)
System Capacity	System capacity supported by the installed power modules.
System Control Card Communication Fail	System control card communication fail
System Control Card Not Ready	System control card is not ready
System Control Card Operating Status	The operating status for this system control card
System Control Card Power Supply Failure	System control card power supply failure
System Date and Time	The system date and time
System Fan Failure	System fan failure - one or more fans have failed
System Input Apparent Power Phs A	The system apparent power on phase A
System Input Apparent Power Phs B	The system apparent power on phase B
System Input Apparent Power Phs C	The system apparent power on phase C
System Input Black Out Count	The number of occurrences, since the last reset, where the input was not qualified to provide power to the system
System Input Brown Out Count	The number of occurrences, since the last reset, where the system input voltage has fallen below a pre-determined threshold for a specified amount of time
System Input Frequency	The system input frequency

Table 3.102 Liebert® APM2—Glossary (continued)

Data Label	Data Description
System Input Nominal Current	The nominal (or rated) system input current
System Input Nominal Voltage	The nominal (or rated) system input voltage
System Input Phs Rotation Error	The power conductors on the input line are not wired to the UPS in the sequence preferred for the rectifier (A-B-C)
System Input Power Factor Phs A	The system input power factor for Phase A
System Input Power Factor Phs B	The system input power factor for Phase B
System Input Power Factor Phs C	The system input power factor for Phase C
System Input Power Phase A	The system input power on phase A
System Input Power Phase B	The system input power on phase B
System Input Power Phase C	The system input power on phase C
System Input Power Problem	The input is not qualified to provide power to the system
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Input RMS Current Phase A	The system input RMS current for Phase A
System Input RMS Current Phase B	The system input RMS current for Phase B
System Input RMS Current Phase C	The system input RMS current for Phase C
System Output Apparent Power Phs A	System output apparent power on phase A
System Output Apparent Power Phs B	System output apparent power on phase B
System Output Apparent Power Phs C	System output apparent power on phase C

Table 3.102 Liebert® APM2—Glossary (continued)

Data Label	Data Description
System Output Apparent Power	The sum total apparent power of all system output phases
System Output Fault	A fault has been detected in the system output
System Output Frequency	The system output frequency
System Output Nominal Frequency	The nominal (or rated) system output frequency
System Output Nominal Voltage	The nominal (or rated) system output voltage
System Output Off	The system output is off
System Output Pct Power Phase A	The system output power on phase A as a percentage of the rated capacity
System Output Pct Power Phase B	The system output power on phase B as a percentage of the rated capacity
System Output Pct Power Phase C	The system output power on phase C as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs A	The system output apparent power on phase A as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs B	The system output apparent power on phase B as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs C	The system output apparent power on phase C as a percentage of the rated capacity
System Output Power Factor Phs A	The system output power factor of phase A
System Output Power Factor Phs B	The system output power factor of phase B
System Output Power Factor Phs C	The system output power factor of phase C
System Output Power Phase A	The system output power on phase A.
System Output Power Phase B	The system output power on phase B.
System Output Power Phase C	The system output power on phase C.
System Output Power	The sum total power of all system output phases
System Output RMS Current Phs A	The system output RMS current for Phase A
System Output RMS Current Phs B	The system output RMS current for Phase B
System Output RMS Current Phs C	The system output RMS current for Phase C

Table 3.102 Liebert® APM2—Glossary (continued)

Data Label	Data Description
System Output Voltage RMS A-B	The system output RMS voltage between phases A and B
System Output Voltage RMS A-N	The system output RMS voltage between phases A and Neutral
System Output Voltage RMS B-C	The system output RMS voltage between phases B and C
System Output Voltage RMS B-N	The system output RMS voltage between phases B and Neutral
System Output Voltage RMS C-A	The system output RMS voltage between phases C and A
System Output Voltage RMS C-N	The system output RMS voltage between phases C and Neutral
System Shutdown - EPO	System shutdown due to Emergency Power Off (EPO)
System Status	The operating status for the system
Time Until Next Auto Battery Test	The time until the next automatic battery test is started.
Top Outlet Fan Fault	Top outlet fan fault - one or more top outlet fans have failed.
Total System Operating Time	The cumulative operation time of the unit
Transfer to Bypass - System Overload	The UPS System has transferred to bypass because the active power modules cannot support the critical load.
Transformer Overtemperature	Indicates a unit transformer overtemperature condition.
UPS Battery Status	UPS battery status
UPS Loading Status	UPS loading status
UPS Output on Bypass	The output power is supplied by the bypass
User Operation Invalid	User attempted an invalid operation.

Table 3.103 Liebert® APS—Status and Coil

Data Label	Status	Coil	Number of Bits	Notes
Input				
Rectifier Failure	10001	—	1	Active on Alarm
System Input Power Problem	10002	—	1	Active on Alarm
System Input Current Imbalance	10003	—	1	Active on Alarm
Bypass				
UPS Output on Bypass	10014	—	1	Active on Alarm
Output Load on Maint. Bypass	10015	—	1	Active on Alarm

<i>If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.</i>					

Table 3.105 Liebert® APS—Glossary

Data Label	Data Description
Accumulated Discharge Time	The highest accumulated battery discharge time among installed battery modules.
Accumulated Discharge Time	Total accumulated discharge time for the Battery Module since it was made.
Auto Battery Test Interval	The time between automatic battery tests.
Auto Restart Delay	If 'Auto Restart' is set to 'enabled' the UPS will not restart the load after a battery discharge until this amount of time has elapsed since the restoration of utility power.
Auto Restart Minimum Battery Setting	The percent state of charge that the batteries must have before the unit is allowed to auto restart.
Auto Restart	When 'enabled', the UPS will automatically restart the load when utility power is restored after a battery discharge.
Automatic Battery Test	Enable/disable the automatic battery test schedule.
Battery Auto Test In Progress	Automatic battery test is in progress.
Battery Discharging	The battery is discharging.
Battery is	Battery charge status..
Battery Manual Test In Progress	Manual battery test is in progress.

Table 3.105 Liebert® APS—Glossary (continued)

Data Label	Data Description
Battery Module Fault	One or more battery modules are reporting a fault condition.
Battery Module Over Temperature	The Battery Module has detected an over temperature condition.
Battery Module Temperature Sensor Fault	A Battery Module temperature sensor fault has been detected.
Battery Module Temperature	The battery temperature measured by the Battery Module.
Battery Module Warning	One or more battery modules are reporting a warning condition.
Battery Over Temperature	A battery temperature sensor is reporting a value above a threshold.
Battery Percentage Charge	The percentage of battery charge.
Battery String Voltage	The voltage between the positive and negative battery terminals of a battery string.
Battery Temperature Imbalance	Excessive temperature differences between battery sensors detected.
Battery Temperature	The highest battery temperature among all installed Battery Modules.
Battery Test Failed	Battery test failed.
Battery Test Passed	Battery test passed.
Battery Time Remaining	The calculated available time on battery.
Battery Volts for Cabinet	The voltage between the positive and negative battery terminals of a battery cabinet.
Bypass Auto Retransfer Failed	After performing a recoverable transfer to bypass, an attempt to auto retransfer from bypass to inverter failed.
Bypass Frequency Error	The bypass frequency is outside the inverter synchronization limits.
Bypass Input Frequency	The bypass input frequency.
Bypass Input Voltage RMS L1-L2	The bypass input RMS voltage between Lines 1 and 2.
Bypass Input Voltage RMS L1-N	The bypass input RMS voltage between Line 1 and Neutral.
Bypass Input Voltage RMS L2-N	The bypass input RMS voltage between Line 2 and Neutral.
Bypass Not Available	A problem associated with the bypass has been detected.
Bypass Overload	Bypass overloaded, reduce load immediately.
Bypass Qualification Status	bypass qualification status.
Charger Mode	The Charger Module is operating in the stated charging mode.
Charger Module Fan Fault	The Charger Module has detected a fan fault.
Check Air Filter	Please check air filter, it may need to be cleaned or replaced.
DC Bus Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value.
Frame Capacity	Total system capacity supported when the maximum number of power modules are installed.

Table 3.105 Liebert® APS—Glossary (continued)

Data Label	Data Description
Frame Fan Fault	The frame top outlet fan has failed.
Inlet Air Temperature	The temperature of the inlet air.
Inverter On/Off State	Inverter on/off state.
Inverter Shutdown - Overload	The inverter has shutdown due to a sustained overload.
Inverter Status	Status of the inverter output. Active means the inverter is online with regulated output voltage and ready to power the load. Inactive means the inverter is offline and not ready to power the load.
Loss of Redundancy	The system has an insufficient number of power modules to provide redundancy.
Low Battery - Shutdown Imminent	If active and guaranteed shutdown is enabled, a low battery reserve condition exists that will shutdown the UPS.
Low Battery Warning Time	When battery time remaining falls to, or below, this value the low battery alarm is activated.
Manual Battery Test	Command to initiate a manual battery test.
Maximum Load Alarm Limit	Maximum load [VA] supportable without a 'Maximum Load Alarm' condition.
Maximum Load Alarm	Maximum load alarm indicating load setting has been exceeded.
Module Operating Status	The operating status for this Battery Module.
Module Operating Status	The operating status for this Bypass Control Module.
Module Operating Status	The operating status for this Charger Module.
Module Operating Status	The operating status for this Power Module.
No Load Warning Current Threshold	If the output current is below this number of amps for a period of [No Load Warning Delay] time, the [No Load Warning] will become active.
No Load Warning Delay	If the output current is below the [No Load Warning Current Threshold] number of amps for this period of time, the [No Load Warning] will become active.
No Load Warning	Indicates the UPS has output voltage but the output current is below a set threshold [No Load Warning Current Threshold] for a set period of time [No Load Warning Delay].
Number of Active Battery Strings	The total number of active battery strings.
Number Of Active Power Modules	The total number of active power modules.
Number of Battery Strings With Warnings	The total number of battery strings with warnings.
Number of Discharge Cycles	The highest number of battery discharge cycles among all installed Battery Modules.
Number of Discharge Cycles	The total number of battery discharge cycles for the Battery Module since it was made.
Number of EBC Installed	The total number of Extended Battery Cabinets installed.
Number of Failed Battery Strings	The total number of failed battery strings.
Number Of Failed Power Modules	The total number of failed power modules.
Number of Installed Battery	The total number of battery strings installed.

Table 3.105 Liebert® APS—Glossary (continued)

Data Label	Data Description
Strings	
Number of Installed Power Modules	The total number of Power Modules installed.
Number Of Power Modules With Warnings	The total number of power modules with warnings.
Number Of Transfers To Bypass	The total number of transfers to bypass from inverter since system startup..
Output Load on Maint. Bypass	The output power is supplied by the maintenance bypass.
Output Off Pending	Output off pending - shutdown imminent.
Output On Delay	When a value is written to this point the output will be turned on after the specified time has elapsed.
Output Overload	An overload exists on the output.
Output Qualification Status	Output qualification status.
Power Module Failure	One or more conditions indicate a power module failure, service is required.
Power Module Fan Fault	The Power Module has detected a fan fault.
Power Module Over Temperature	The Power Module has detected an over temperature condition.
Power Module Shutdown - Over Temperature	Power Module has shutdown due to over temperature.
Power Module Warning	One or more power modules is reporting a warning condition.
Reboot With Delay	When a value is written to this point the output will be turned off immediately and then turned back on after the specified time has elapsed.
Rectifier Failure	Rectifier failure - rectifier is off
Replace Battery Module	The Battery Module needs to be replaced.
Server Class	The general classification for this system.
Shutdown After Delay	When a value is written to this point the system will shutdown after the specified time has elapsed and output will remain off.
System Capacity	System capacity supported by the installed power modules.
System Date and Time	The system date and time.
System Input Black Out Count	The number of occurrences, since the last reset, where the input was not qualified to provide power to the system.
System Input Brown Out Count	The number of occurrences, since the last reset, where the system input voltage has fallen below a pre-determined threshold for a specified amount of time.
System Input Current Imbalance	System Input Currents are Imbalanced.
System Input Frequency	The system input frequency.
System Input Power Factor L1	The system input power factor for Line 1.
System Input Power Factor L2	The system input power factor for Line 2.

Table 3.105 Liebert® APS—Glossary (continued)

Data Label	Data Description
System Input Power Factor L3	The system input power factor for Line 3.
System Input Power Problem	The input is not qualified to provide power to the system.
System Input RMS Current L1	The system input RMS current for Line 1.
System Input RMS Current L2	The system input RMS current for Line 2.
System Input RMS Current L3	The system input RMS current for Line 3.
System Input RMS L1-L2	The System Input RMS Voltage between Line 1 and Line 2.
System Input RMS L1-N	The System Input RMS Voltage between Line 1 and Neutral.
System Input RMS L2-L3	The System Input RMS Voltage between Line 2 and Line 3.
System Input RMS L2-N	The System Input RMS Voltage between Line 2 and Neutral.
System Input RMS L3-L1	The System Input RMS Voltage between Line 3 and Line 1.
System Input RMS L3-N	The System Input RMS Voltage between Line 3 and Neutral.
System Output Apparent Power L1	System output apparent power on Line 1.
System Output Apparent Power L2	System output apparent power on Line 2.
System Output Apparent Power	The sum total apparent power of all system output phases.
System Output Frequency	The system output frequency.
System Output Off	The system output is off.
System Output Pct Power L1	The system output power on Line 1 as a percentage of the rated capacity.
System Output Pct Power L2	The system output power on Line 2 as a percentage of the rated capacity.
System Output Power Factor L1	The system output power factor of Line 1.
System Output Power Factor L2	The system output power factor of Line 2.
System Output Power L1	The system output power on Line 1.
System Output Power L2	The system output power on Line 2.
System Output Power	The sum total power of all system output phases.
System Output RMS Current L1	The system output RMS current for Line 1.
System Output RMS Current L2	The system output RMS current for Line 2.
System Output Voltage RMS L1-L2	The system output RMS voltage between Lines 1 and 2.
System Output Voltage RMS L1-N	The system output RMS voltage between Line 1 and Neutral.
System Output Voltage RMS L2-N	The system output RMS voltage between Line 2 and Neutral.
System Set To Operate With	If this point reports 'Redundancy' then the system is configured for redundancy and the 'Loss of Redundancy' alarm is

Table 3.105 Liebert® APS—Glossary (continued)

Data Label	Data Description
	enabled.
System Shutdown - Hardware Fault	Shutdown was due to an externally applied hardware control signal.
System Shutdown - Low Battery	Shutdown was due to a low battery condition.
System Shutdown - Output Short	Shutdown was due to a short on the output.
System Shutdown - Remote Shutdown	Shutdown was due to a remote communications shutdown command.
System Shutdown - Transformer Over Temperature	System shutdown due to transformer over temperature.
System Status	The operating status for the system.
Time Until Next Auto Battery Test	The time until the next automatic battery test is started.
Transformer Fan Fault	The transformer fan has failed.
Transformer Overtemperature	Transformer temperature has exceeded the limit.
Unspecified General Event	One or more unspecified events active. See local unit display for further details.
UPS Battery Status	UPS battery status.
UPS Output on Bypass	The output power is supplied by the bypass.
UPS Output Source	UPS output source.

Table 3.108 Liebert® EPM—Glossary

Data Label	Data Description
Advanced Efficiency Mode	Advanced efficiency modes where the UPS supports the critical load using the static bypass.
Average system efficiency	Average system efficiency.
Battery Breaker 1 Open Failure	Battery circuit breaker 1 failed to open.
Battery Breaker 2 Open Failure	Battery circuit breaker 2 failed to open.
Battery Breaker 3 Open Failure	Battery circuit breaker 3 failed to open.
Battery Breaker 4 Open Failure	Battery circuit breaker 4 failed to open.
Battery Capacity Low	Battery capacity is low.
Battery Charge Equalization Timeout	The battery equalizing is time out.
Battery Charging Error	The battery is not charging properly.
Battery Charging Inhibited	Battery charging is inhibited due to an external inhibit signal.
Battery Circuit Breaker 1 Open	Battery circuit breaker 1 is open.
Battery Circuit Breaker 2 Open	Battery circuit breaker 2 is open.
Battery Circuit Breaker 3 Open	Battery circuit breaker 3 is open.
Battery Circuit Breaker 4 Open	Battery circuit breaker 4 is open.
Battery Converter Current Limit	The battery converter has reached its maximum current limit.
Battery Converter Failure	Battery converter failure. This is a summary event caused by one or more power sub-modules in a UPS module.
Battery Discharging	The battery is discharging.
Battery Equalize	The rectifier output voltage is increased to equalize the battery voltage level.

Table 3.108 Liebert® EPM—Glossary (continued)

Data Label	Data Description
Battery Fault	A short circuit exists in the battery system.
Battery Ground Fault	Battery system ground fault amperage exceeds the threshold.
Battery Low	The calculated battery time remaining has reached the low battery threshold
Battery Not Qualified	The UPS battery voltage is not qualified. This event will be detected even in the absence of battery disconnect or when it is open.
Battery Over Temperature	A battery temperature sensor is reporting a value above a threshold.
Battery Room Alarm	The ambient temperature of the battery room is abnormal.
Battery Self Test	Battery self-test is in progress.
Battery Temperature for Cabinet	The battery temperature for a cabinet.
Battery Terminals Reversed	The measured battery voltage is a negative value due to reverse battery terminal connections.
Battery Time Remaining	The calculated available time on battery.
Battery Volts for Cabinet	The voltage between the positive and negative battery terminals of a battery cabinet.
Bypass - Excess Auto Retransfers	The number of auto retransfers, from bypass to inverter, has exceeded the maximum for a specified time interval.
Bypass Backfeed Detected	The system detected a voltage on the bypass when none was expected.
Bypass Input Frequency	The bypass input frequency.
Bypass Input Voltage Fault	The system has detected the bypass voltage is unqualified.
Bypass Input Voltage RMS A-B	The bypass input RMS voltage between Phases A and B.
Bypass Input Voltage RMS A-N	The bypass input RMS voltage between Phase A and Neutral.
Bypass Input Voltage RMS B-C	The bypass input RMS voltage between Phases B and C.
Bypass Input Voltage RMS B-N	The bypass input RMS voltage between Phase B and Neutral.
Bypass Input Voltage RMS C-A	The bypass input RMS voltage between Phases C and A.
Bypass Input Voltage RMS C-N	The bypass input RMS voltage between Phase C and Neutral.
Bypass Nominal Voltage	Bypass nominal (or rated) voltage.
Bypass Not Available	A problem associated with the bypass has been detected.
Bypass Static Switch Unavailable	The static bypass is unavailable to support the critical load.
DC Bus Abnormal	The system has detected an abnormal DC Bus Voltage.
DC Bus Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value.

Table 3.108 Liebert® EPM—Glossary (continued)

Data Label	Data Description
ECO Mode Operation State	This setting is used to enable or disable ECO Mode.
Equipment Over Temperature	Equipment over temperature summary event.
Excess ECO Suspends	Number of automatic suspensions has exceeded the ECO Mode - Maximum Auto Suspensions setting.
Fuse Failure	A summary event indicating one or more fuse failures.
Inlet Air Temperature	The temperature of the inlet air.
Input Breaker	Input breaker.
Input Source Backfeed	The battery is back-feeding the input source.
Intelligent Parallel Operation State	This setting is used to enable or disable Intelligent Paralleling.
Internal Bypass Breaker	Internal bypass breaker.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus.
Inverter Failure	Inverter failure - inverter output is off.
Inverter On/Off State	Inverter on/off state.
Inverter Overload	Inverter in overload fault.
Inverter Relay Fault	The inverter relay has malfunctioned.
Inverter Shutdown - Overload	The inverter has shutdown due to a sustained overload.
LBS Cable Failure	Load Bus Sync communications is abnormal. A problem with the LBS cable may exist.
LBS Inhibited	The system has detected that conditions to perform Load Bus Sync are not satisfied.
Load Impact Transfer	On bypass as result of load impact.
Load Sharing Fault	Difference between any phase inverter current of unit and the relevant average output current of parallel system is more than a specific percent of nominal current.
Loss of Redundancy	The multi-module collection doesn't have enough modules to satisfy the redundancy configuration.
Loss of Synchronization	The inverter and bypass are no longer synchronized.
Main Battery Disconnect Open	Main battery disconnect is open.
Mains Input Neutral Lost	Loss of neutral in the input source is detected.
Maintenance Bypass Breaker	Maintenance bypass breaker.
MMS On Battery	The multi-module system is on battery.
MMS Output Apparent Power	The sum total apparent power of all system output modules.
MMS Output Power	The sum total power of all system output modules.
MMS Over Capacity	The multi-module system load is larger than the apparent power limit setting.

Table 3.108 Liebert® EPM—Glossary (continued)

Data Label	Data Description
MMS Overload	Multi-module system overload.
MMS UPS Output Source	Multi-module UPS output source.
On Generator	A generator is supplying the power to the system.
Output Breaker	Output breaker
Output Current Crest Factor Phs A	Output current crest factor of Phase A.
Output Current Crest Factor Phs B	Output current crest factor of Phase B.
Output Current Crest Factor Phs C	Output current crest factor of Phase C.
Output Load on Maint. Bypass	The output power is supplied by the maintenance bypass.
Parallel Cable Failure	The UPS parallel system communications is abnormal. A problem with the parallel cable may exist.
Parallel Comm Warning	Parallel communication bus warning.
Power Module Over Temperature	The Power Module has detected an over temperature condition.
Power Supply Failure	Power supply failure.
Rectifier Failure	Rectifier failure - rectifier is off.
System Date and Time	The system date and time.
System Fan Failure	System fan failure - one or more fans have failed.
System Input Current Imbalance	System Input Currents are Imbalanced.
System Input Current Limit	The RMS input current has reached the input current limit threshold.
System Input Frequency	The system input frequency.
System Input Nominal Current	The nominal (or rated) system input current.
System Input Nominal Frequency	The nominal (or rated) system input frequency.
System Input Nominal Voltage	The nominal (or rated) system input voltage.
System Input Phs Rotation Error	The power conductors on the input line are not wired to the UPS in the sequence preferred for the rectifier (A-B-C).
System Input Power Factor Phs A	The system input power factor for Phase A.
System Input Power Factor Phs B	The system input power factor for Phase B.
System Input Power Factor Phs C	The system input power factor for Phase C.

Table 3.108 Liebert® EPM—Glossary (continued)

Data Label	Data Description
System Input Power Problem	The input is not qualified to provide power to the system.
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B.
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral.
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C.
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral.
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A.
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral.
System Input RMS Current Phase A	The system input RMS current for Phase A.
System Input RMS Current Phase B	The system input RMS current for Phase B.
System Input RMS Current Phase C	The system input RMS current for Phase C.
System Output Apparent Power Phs A	System output apparent power on Phase A.
System Output Apparent Power Phs B	System output apparent power on Phase B.
System Output Apparent Power Phs C	System output apparent power on Phase C.
System Output Apparent Power	The sum total apparent power of all system output phases.
System Output Fault	A fault has been detected in the system output.
System Output Frequency	The system output frequency.
System Output Nominal Frequency	The nominal (or rated) system output frequency.
System Output Nominal Voltage	The nominal (or rated) system output voltage.
System Output Pct Power Phase A	The system output power on Phase A as a percentage of the rated capacity.
System Output Pct Power Phase B	The system output power on Phase B as a percentage of the rated capacity.
System Output Pct Power Phase C	The system output power on Phase C as a percentage of the rated capacity.
System Output Power Factor Phs A	The system output power factor of Phase A.
System Output Power Factor Phs B	The system output power factor of Phase B.
System Output Power	The system output power factor of Phase C.

Table 3.108 Liebert® EPM—Glossary (continued)

Data Label	Data Description
Factor Phs C	
System Output Power Phase A	The system output power on Phase A.
System Output Power Phase B	The system output power on Phase B.
System Output Power Phase C	The system output power on Phase C.
System Output Power	The sum total power of all system output phases.
System Output RMS Current Phs A	The system output RMS current for Phase A.
System Output RMS Current Phs B	The system output RMS current for Phase B.
System Output RMS Current Phs C	The system output RMS current for Phase C.
System Output Voltage RMS A-B	The system output RMS voltage between Phases A and B.
System Output Voltage RMS A-N	The system output RMS voltage between Phases A and Neutral.
System Output Voltage RMS B-C	The system output RMS voltage between Phases B and C.
System Output Voltage RMS B-N	The system output RMS voltage between Phases B and Neutral.
System Output Voltage RMS C-A	The system output RMS voltage between Phases C and A.
System Output Voltage RMS C-N	The system output RMS voltage between Phases C and Neutral.
System Shutdown - EPO	System shutdown due to Emergency Power Off (EPO).
System Status	The operating status for the system.
Top Outlet Fan Fault	Top outlet fan fault - one or more top outlet fans have failed.
Total System Operating Time	The cumulative operation time of the unit.
Transfer to Bypass - System Overload	The UPS System has transferred to bypass because the active power modules cannot support the critical load.
UPS Application Mode	UPS application mode.
UPS battery1 status	UPS battery status
UPS Output on Bypass	The output power is supplied by the bypass.
UPS Output Source	UPS output source.
User Operation Invalid	User attempted an invalid operation.

If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.					

Table 3.111 Liebert® EXL—Glossary

Data Label	Data Description
Auto Calibration Active	The system is automatically calibrating ADC channels.
Auto Calibration Failed	ADC channel calibration has failed.
Auto Restart In Progress	Auto restart is in progress.
Auto Restart Inhibited - Ext	Auto restart inhibited due to an external signal.
Auto Retransfer Time Remaining	Time remaining before an inverter overload or inverter fault can be cleared and auto retransfer from the bypass to the inverter can take place.
Automatic Battery Test	Enable/disable the automatic battery test schedule.
Automatic Restart Failed	Automatic restart failed.
Backfeed Breaker Open	The backfeed breaker is in the open position.
Backfeed Breaker	Backfeed breaker.
Battery - External Monitor 1	External battery monitor 1 - battery maintenance required.
Battery - External Monitor 2	External battery monitor 2 - battery maintenance required.
Battery Amp-Hours Consumed This Discharge	Battery amp-hours withdrawn this discharge.
Battery Breaker Operation	Indicates the type of breaker installed for the batteries.
Battery Capacity Low	Battery capacity is low.
Battery Cell Count - Lead Acid	Battery cell count - lead acid.
Battery Cell Count Adjust	The cell count adjustment for the batteries currently installed.
Battery Cell Count	The cell count of the attached battery.
Battery Circuit Breaker 1 Open	Battery circuit breaker 1 is open.
Battery Circuit Breaker 2 Open	Battery circuit breaker 2 is open.
Battery Circuit Breaker 3 Open	Battery circuit breaker 3 is open.
Battery Circuit Breaker 4 Open	Battery circuit breaker 4 is open.
Battery Circuit Breaker 5 Open	Battery circuit breaker 5 is open.
Battery Circuit Breaker 6 Open	Battery circuit breaker 6 is open.
Battery Circuit Breaker 7 Open	Battery circuit breaker 7 is open.

Table 3.111 Liebert® EXL—Glossary (continued)

Data Label	Data Description
Battery Circuit Breaker 8 Open	Battery circuit breaker 8 is open.
Battery Commission Date	Date and time when battery placed into service.
Battery Discharge Power	Instantaneous battery power while discharging.
Battery Discharge Time	The time on battery operation for this discharge.
Battery Discharging	The battery is discharging.
Battery Disconnect Setting	Allow the battery overtemp to initiate a battery disconnect.
Battery Equalize Time	The duration used when the battery is being equalized.
Battery Equalize Voltage	The cell voltage that will be used when the battery is being equalized.
Battery Equalize	The rectifier output voltage is increased to equalize the battery voltage level.
Battery Float Voltage	The cell voltage of the battery at float recharging.
Battery Low Shutdown	Battery disconnect due to end-of-discharge.
Battery Low	The calculated battery time remaining has reached the low battery threshold.
Battery Over Temp Limit Setting	The temperature setting that will initiate an over temperature limit.
Battery Over Temp Warn Setting	The temperature setting that will initiate an over temperature warning.
Battery Over Temperature Limit	A battery temperature sensor is reporting a value above a predetermined limit.
Battery Percentage Charge	The percentage of battery charge.
Battery Recharge Method	The recharge method used for battery recharging.
Battery Recharge Voltage	The recharge cell voltage for the battery.
Battery Self Test Cycle Time	The time between automatic battery self test cycles.
Battery Self Test Duration	The duration of a successful battery self test cycle.
Battery Self Test Minimum Voltage	Minimum cell voltage acceptable during a successful battery test.
Battery Self Test Start Date	The date that the battery self tests will begin happening.
Battery Self Test Time of Test	The time of day that the automatic self test will be initiated.
Battery Self Test	Battery self-test is in progress.
Battery Temperature for Cabinet	The battery temperature for a cabinet.
Battery Temperature Imbalance	Excessive temperature differences between battery sensors detected.
Battery Temperature Sensor Fault	A battery temperature sensor fault has been detected.
Battery Test Failed	Battery test failed.
Battery Test Inhibited	Automatic (scheduled) battery tests are inhibited.
Battery Time Remaining	The calculated available time on battery.
Battery Total Discharge Time	The cumulative battery discharge time.

Table 3.111 Liebert® EXL—Glossary (continued)

Data Label	Data Description
Battery Volts for Cabinet	The voltage between the positive and negative battery terminals of a battery cabinet.
Bypass - Excess Auto Retransfers	The number of auto retransfers, from bypass to inverter, has exceeded the maximum for a specified time interval.
Bypass - Manual Rexfr Inhibited	Manual transfer from bypass to inverter is inhibited.
Bypass - Manual Xfr Inhibited	Manual transfer from inverter to bypass is inhibited.
Bypass Auto Retransfer Failed	After performing a recoverable transfer to bypass, an attempt to auto retransfer from bypass to inverter failed.
Bypass Auto Retransfer Primed	Automatic retransfer from bypass to inverter is possible.
Bypass Auto Transfer Failed	An automatic transfer to static bypass failed.
Bypass Excessive Pulse Parallel	The system has performed too many pulse parallel operations within a specified time interval
Bypass Input Frequency	The bypass input frequency.
Bypass Input Voltage RMS A-B	The bypass input RMS voltage between Phases A and B.
Bypass Input Voltage RMS B-C	The bypass input RMS voltage between Phases B and C.
Bypass Input Voltage RMS C-A	The bypass input RMS voltage between Phases C and A.
Bypass Isolation Breaker for Module 1	Bypass isolation breaker for Module 1.
Bypass Isolation Breaker for Module 2	Bypass isolation breaker for Module 2.
Bypass Isolation Breaker for Module 3	Bypass isolation breaker for Module 3.
Bypass Isolation Breaker for Module 4	Bypass isolation breaker for Module 4.
Bypass Isolation Breaker for Module 5	Bypass isolation breaker for Module 5.
Bypass Isolation Breaker for Module 6	Bypass isolation breaker for Module 6.
Bypass Isolation Breaker for Module 7	Bypass isolation breaker for Module 7.
Bypass Isolation Breaker for Module 8	
Bypass Isolation Breaker	Bypass isolation breaker.
Bypass Nominal Voltage	Bypass nominal (or rated) voltage.
Bypass Not Available	A problem associated with the bypass has been detected.
Bypass Overload Phase A	An overload exists on output Phase A while operating on the bypass.
Bypass Overload Phase B	An overload exists on output Phase B while operating on the bypass.
Bypass Overload Phase C	An overload exists on output Phase C while operating on the bypass.
Bypass Qualification Status	Bypass qualification status.
Bypass SS Overload Time Remain	The calculated time remaining before bypass static switch shutdown due to the present overload condition.

Table 3.111 Liebert® EXL—Glossary (continued)

Data Label	Data Description
Bypass Static Switch Overload	Bypass off due to static switch overload.
Bypass Static Switch Unavailable	The static bypass is unavailable to support the critical load.
Bypass Sync Phase Difference	The phase angle difference between the inverter output and bypass source.
Bypass Undervoltage Warning	The voltage on one or more bypass phases is less than a specified percentage of the nominal voltage.
Cont Tie Active	Continuous Power Tie Active.
Continuous Operation - ECO Mode	This setting gives the user the ability to Enable/Disable ECO Mode continuous operation.
Controls Reset Required	A controls reset is required due to one or more critical settings changing.
DC Bus Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value.
DC Bus Qualification Status	DC bus qualification status.
DC Bus Voltage	The voltage between the positive and negative terminals of the DC bus at the battery input.
DC Converter Status	The operating state of the dc converter.
Delay for Input Contact 01	The activation delay associated with input contact 1.
Delay for Input Contact 02	The activation delay associated with input contact 2.
Delay for Input Contact 03	The activation delay associated with input contact 3.
Delay for Input Contact 04	The activation delay associated with input contact 4.
Delay for Input Contact 05	The activation delay associated with input contact 5.
Delay for Input Contact 06	The activation delay associated with input contact 6.
Delay for Input Contact 07	The activation delay associated with input contact 7.
Delay for Input Contact 08	The activation delay associated with input contact 8.
Delay for Input Contact 09	The activation delay associated with input contact 9.
Delay for Input Contact 10	The activation delay associated with input contact 10.
Delay for Input Contact 11	The activation delay associated with input contact 11.
Delay for Input Contact 12	The activation delay associated with input contact 12.
Delay for Input Contact 13	The activation delay associated with input contact 13.
Delay for Input Contact 14	The activation delay associated with input contact 14.
Delay for Input Contact 15	The activation delay associated with input contact 15.
Delay for Input Contact 16	The activation delay associated with input contact 16.
ECO Mode Active	Conditions for Activation or Automatic Reactivation have been satisfied.
ECO Mode Operation State	This setting is used to enable or disable ECO Mode.
ECO Mode Suspended	ECO Mode session is suspended.
EMO Shutdown	An Emergency Module Off command has been detected.
Equipment Over Temp Warning	Equipment over temperature warning is a summary event based on the detection of at least one measured

Table 3.111 Liebert® EXL—Glossary (continued)

Data Label	Data Description
	temperature exceeding a threshold.
Equipment Temperature Sensor Fail	One or more temperature sensors report a temperature outside of the range of expected operation.
Excess ECO Suspends	Number of automatic suspensions has exceeded the ECO Mode - Maximum Auto Suspensions setting.
Fuse Failure	A summary event indicating one or more fuse failures.
Ground Fault	An AC phase-to-ground fault or three-phase fault-to-ground exists on the output of the UPS.
Include Input Contact Interface 1 Alarms In Summary	Should the inputs on input contact interface 1 be included in the summary event when activated.
Include Input Contact Interface 2 Alarms In Summary	Should the inputs on input contact interface 2 be included in the summary event when activated.
Inlet Air Over Temperature	The inlet air exceeds the maximum temperature threshold.
Inlet Air Temperature	The temperature of the inlet air
Inlet Air Warning Setting	The temperature setting that will cause an input temperature warning.
Input Breaker (CB1/RIB)	Input breaker (CB1/RIB).
Input Breaker Operation	Indicates the type of breaker installed for the Input.
Input Contact 01	The external input contact 1.
Input Contact 02	The external input contact 2.
Input Contact 03	The external input contact 3.
Input Contact 04	The external input contact 4.
Input Contact 05	The external input contact 5.
Input Contact 06	The external input contact 6.
Input Contact 07	The external input contact 7.
Input Contact 08	The external input contact 8.
Input Contact 09	The external input contact 9.
Input Contact 10	The external input contact 10.
Input Contact 11	The external input contact 11.
Input Contact 12	The external input contact 12.
Input Contact 13	The external input contact 13.
Input Contact 14	The external input contact 14.
Input Contact 15	The external input contact 15.
Input Contact 16	The external input contact 16.
Input Qualification Status	Input qualification status.
Input Undervoltage	One or more of the input phase voltages has dropped below the limit.
Intelligent Parallel Maximum Time	The maximum time a module can be in standby mode due to Intelligent Paralleling.

Table 3.111 Liebert® EXL—Glossary (continued)

Data Label	Data Description
in Standby	
Intelligent Parallel Minimum Redundancy	This is the minimum Number of Redundant Modules that the system will allow before bringing one or more modules back to normal operation and terminating Intelligent Paralleling.
Intelligent Parallel Mode	This setting gives the user the ability to choose between different energy consumption modes while Intelligent Paralleling is active and module is in standby.
Intelligent Parallel Operation State	This setting is used to enable or disable Intelligent Paralleling.
Intelligent Paralleling Shutdown Delay	This is the length of time the conditions for module standby must remain satisfied before the module goes into standby.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus.
Inverter Failure	Inverter failure - inverter output is off.
Inverter On/Off State	Inverter on/off state.
Inverter Output Qualification Status	Inverter output qualification status.
Inverter Overload Phase A	Inverter is operating with an overload on Phase A.
Inverter Overload Phase B	Inverter is operating with an overload on Phase B.
Inverter Overload Phase C	Inverter is operating with an overload on Phase C.
Inverter Overload Time Remaining	The calculated time remaining before inverter shutdown.
Inverter Shutdown - Overload	The inverter has shutdown due to a sustained overload.
LBS Active - Master	This UPS system has been selected as the functional Master Load Bus Synchronization (LBS) system.
LBS Active - Slave	This UPS system is synchronized to the output bus of the UPS system that has been selected as the Master Load Bus Synchronization (LBS) system.
LBS Inhibited	The system has detected that conditions to perform Load Bus Sync are not satisfied.
Loss of Redundancy	The multi-module collection doesn't have enough modules to satisfy the redundancy configuration.
Low Battery Warning Time	When battery time remaining falls to, or below, this value the low battery alarm is activated.
Main Battery Disconnect Open	Main battery disconnect is open.
Main Controller Fault	A Main Controller fault has been detected.
Maintenance Bypass Breaker	Maintenance bypass breaker.
Maintenance Isolation Breaker	Maintenance isolation breaker.
Manual Transfer Bypass Voltage High Limit	The manual bypass voltage high limit setting.
Manual Transfer Bypass Voltage Low Limit	The manual bypass voltage low limit setting.
Maximum Auto Suspensions - ECO Mode	This setting sets the maximum number of automatic ECO Mode suspensions in a session.

Table 3.111 Liebert® EXL—Glossary (continued)

Data Label	Data Description
Maximum Load Exceeded Delay	The maximum load exceeded event delay time.
Maximum Load Exceeded Phase A	The maximum load current exceeded setting for Phase A.
Maximum Load Exceeded Phase B	The maximum load current exceeded setting for Phase B.
Maximum Load Exceeded Phase C	The maximum load current exceeded setting for Phase C.
Memory Card Removed	The memory card on the control board has been removed.
MMS Event Summary	Summary of any active user alarm or fault of this module in a multi-module system.
MMS Inter-Module Comm Status	Intermodule communication status of this module in a multi-module system.
MMS Low Battery Warning	Multi-module system low battery warning.
MMS Module Alarm Active	Active alarm or fault of any module in a multi-module system.
MMS Module Battery Current	Battery current of this module in a multi-module system.
MMS Module Battery Time Remaining	Battery time remaining for this module in a multi-module system.
MMS Module DC Bus Voltage	DC bus voltage of this module in a multi-module system.
MMS Module Inverter Status	Multi-module inverter status of this module (on/off).
MMS Module Number	MMS module number
MMS Module Output Source	Module output source in a multi-module system (normal/bypass/maintenance bypass/off).
MMS Module Output Voltage Status	Output voltage status of this module in multi-module system.
MMS Module Total kVA Output	Total kVA output of this module in a multi-module system.
MMS Module Total kW Output	Total kW output of this module in a multi-module system.
MMS On Battery	The multi-module system is on battery
MMS Output Apparent Power	The sum total apparent power of all system output modules.
MMS Output Frequency	The multi-module system output frequency.
MMS Output Pct Apparent Pwr (kVA) Phase A	The multi-module system output apparent power on Phase A as a percentage of the rated capacity.
MMS Output Pct Apparent Pwr (kVA) Phase B	The multi-module system output apparent power on Phase B as a percentage of the rated capacity.
MMS Output Pct Apparent Pwr (kVA) Phase C	The multi-module system output apparent power on Phase C as a percentage of the rated capacity.
MMS Output Pct Power Phase A	The multi-module system output power on Phase A as a percentage of the rated capacity.
MMS Output Pct Power Phase B	The multi-module system output power on Phase B as a percentage of the rated capacity.
MMS Output Pct Power Phase C	The multi-module system output power on Phase C as a percentage of the rated capacity.
MMS Output Power Factor Phase	The multi-module system output power factor for Phase A.

Table 3.111 Liebert® EXL—Glossary (continued)

Data Label	Data Description
A	
MMS Output Power Factor Phase B	The multi-module system output power factor for Phase B.
MMS Output Power Factor Phase C	The multi-module system output power factor for Phase C.
MMS Output Power	The sum total power of all system output modules.
MMS Overload	Multi-module system overload.
MMS Retransfer Inhibit	The critical load can not be manually retransferred from bypass to inverter.
MMS Transfer Inhibit	The critical load can not be manually transferred from inverter to bypass.
MMS UPS Battery Status	Multi-module UPS battery status
MMS UPS Output Source	Multi-module UPS output source.
Module Accumulated Energy	Total accumulated energy output for this module, since last energy reset.
Module In Standby - Intelligent Paralleling	Module is placed into standby operation per Intelligent Paralleling.
Module Output Breaker for Module 1	Module output breaker for Module 1.
Module Output Breaker for Module 2	Module output breaker for Module 2.
Module Output Breaker for Module 3	Module output breaker for Module 3.
Module Output Breaker for Module 4	Module output breaker for Module 4.
Module Output Breaker for Module 5	Module output breaker for Module 5.
Module Output Breaker for Module 6	Module output breaker for Module 6.
Module Output Breaker for Module 7	Module output breaker for Module 7.
Module Output Breaker for Module 8	Module output breaker for Module 8.
Module Output Breaker Open	The module output breaker is open.
Multi-Module System Output Voltage RMS A-B	Multi-module system output RMS voltage between Phases A and B.
Multi-Module System Output Voltage RMS A-N	Multi-module system output RMS voltage between Phase B and Neutral.
Multi-Module System Output Voltage RMS B-C	Multi-module system output RMS voltage between Phases B and C.
Multi-Module System Output Voltage RMS B-N	Multi-module system output RMS voltage between Phase B and Neutral.

Table 3.111 Liebert® EXL—Glossary (continued)

Data Label	Data Description
Multi-Module System Output Voltage RMS C-A	Multi-module system output RMS voltage between Phases C and A.
Multi-Module System Output Voltage RMS C-N	Multi-module system output RMS voltage between Phase C and Neutral.
Multiple Fan Failure	Multiple fan failure.
Number of Modules in a MMS	The number of modules in a multi-module system.
Number of Redundant Modules	The number of redundant modules in a multi-module collective.
On Generator	A generator is supplying the power to the system.
Outlet Air Overtemperature Limit	The difference between the outlet air temperature and inlet air temperature exceeds a specified maximum temperature.
Output Amp Over User Limit-Phs A	The Phase A output has exceeded the user amperage threshold.
Output Amp Over User Limit-Phs B	The Phase B output has exceeded the user amperage threshold.
Output Amp Over User Limit-Phs C	The Phase C output has exceeded the user amperage threshold.
Output Apparent Power Rating	Output apparent power rating.
Output Breaker (CB2/IOB)	Output breaker (CB2/IOB).
Output Breaker Operation	Indicates the type of breaker installed for the output.
Output kWh Reset Timestamp	The date/time stamp when the User kWh accumulator was last reset to zero.
Output Load on Maint. Bypass	The output power is supplied by the maintenance bypass.
Output Of/Uf	The output frequency has exceeded a specified range for a specified period of time.
Output Peak kW Demand Hist	The Output Peak kW Demand for the last completed programmed time interval.
Output Peak kW Demand	The Output Peak kW Demand for the programmed time interval.
Output Qualification Status	Output qualification status.
Output Real Power Rating	Output real power rating.
Parallel Cable Failure	The UPS parallel system communications is abnormal. A problem with the parallel cable may exist.
Parallel Comm Warning	Parallel communication bus warning.
Peak kW Demand Period	The Peak kW Demand Period.
Peak kW Demand Timestamp	The date/time stamp when the Peak kW Demand accumulator was last reset.
Power Supply Failure	Power supply failure
PRB Delay	Programmable Relay Board activation delay time.
PRB Relay Trigger Event # 1	Programmable Relay Board Trigger Event # 1.
PRB Relay Trigger Event # 2	Programmable Relay Board Trigger Event # 2.
PRB Relay Trigger Event # 3	Programmable Relay Board Trigger Event # 3.

Table 3.111 Liebert® EXL—Glossary (continued)

Data Label	Data Description
PRB Relay Trigger Event # 4	Programmable Relay Board Trigger Event # 4.
Precharge Circuit Failed	DC Bus precharge/discharge didn't reach specified level within a specified time.
Precharge Contactor	The Precharge Contactor is engaged to pre-charge the DC bus in preparation for starting the Rectifier.
Rectifier Failure	Rectifier failure - rectifier is off.
Rectifier Feed Breaker (RFB)	Rectifier feed breaker (RFB).
Rectifier Status	Rectifier status.
Regeneration Active	Regeneration operation is active.
Regeneration Operation Failure	Regeneration operation has been terminated due to bypass source instability or unit misoperation.
Regeneration Operation Terminated	Regeneration operation is not active.
Regeneration Time Remaining	The time remaining until the termination of regeneration mode.
Restart Delay - ECO Mode	The time delay that the conditions to activate ECO Mode must be satisfied before ECO Mode can be reactivated during an active session.
SCC Event Summary	Summary of any active user alarms or faults on the SCC.
Schedule Action - ECO Mode	This setting gives the user the ability to choose the action of a schedule entry to be either stop or start.
Schedule Day of Week - ECO Mode	This setting represents the day of the week when an associated ECO Mode schedule entry action will take effect.
Schedule Hour - ECO Mode	This setting represents the hour of the day when an associated schedule entry action will take effect.
Schedule Minute - ECO Mode	This setting represents the minute of the hour when an associated schedule entry action will take effect.
Schedule Operation State - ECO Mode	This setting gives the user the ability to either enable or disable a schedule entry if the action is Start.
Service Code Active	Service code is running.
Service Required	Unit requires servicing.
Static Bypass Switch	Static Bypass Switch state - On/Off.
Sum of MMS Output RMS Currents for Phase A	The sum of the multi-module system output RMS currents for Phase A.
Sum of MMS Output RMS Currents for Phase B	The sum of the multi-module system output RMS currents for Phase B.
Sum of MMS Output RMS Currents for Phase C	The sum of the multi-module system output RMS currents for Phase C.
System Accumulated Energy	Total accumulated energy output for the mms system, since last energy reset.
System Breaker(s) Close Failure	One or more breakers in the system failed to close.
System Breaker(s) Open Failure	One or more breakers in the system failed to open.
System Controller Error	System controller internal error.
System Date and Time	The system date and time.

Table 3.111 Liebert® EXL—Glossary (continued)

Data Label	Data Description
System Fan Failure - Redundant	Redundant system fan failure.
System Input Current Limit	The RMS input current has reached the input current limit threshold.
System Input Frequency	The system input frequency.
System Input Nominal Frequency	The nominal (or rated) system input frequency.
System Input Nominal Voltage	The nominal (or rated) system input voltage.
System Input Power Problem	The input is not qualified to provide power to the system.
System Input Power Source	System input power source
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B.
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C.
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A.
System Input RMS Current Phase A	The system input RMS current for Phase A.
System Input RMS Current Phase B	The system input RMS current for Phase B.
System Input RMS Current Phase C	The system input RMS current for Phase C.
System Isolation Output Breaker	System isolation output breaker.
System Load Bank Breaker	System load bank breaker.
System Output Apparent Power	The sum total apparent power of all system output phases.
System Output Breaker	System output breaker.
System Output Fault	A fault has been detected in the system output
System Output Frequency	The system output frequency.
System Output Low Power Factor	The system output power factor is low, resulting in reduced output capacity.
System Output Maximum Amp Rating	System output maximum amperage rating.
System Output Nominal Frequency	The nominal (or rated) system output frequency.
System Output Nominal Voltage	The nominal (or rated) system output voltage.
System Output Pct Power Phase A	The system output power on Phase A as a percentage of the rated capacity.
System Output Pct Power Phase B	The system output power on Phase B as a percentage of the rated capacity.
System Output Pct Power Phase C	The system output power on Phase C as a percentage of the rated capacity.
System Output Pct Pwr (VA) Phs A	The system output apparent power on Phase A as a percentage of the rated capacity.

Table 3.111 Liebert® EXL—Glossary (continued)

Data Label	Data Description
System Output Pct Pwr (VA) Phs B	The system output apparent power on Phase B as a percentage of the rated capacity.
System Output Pct Pwr (VA) Phs C	The system output apparent power on Phase C as a percentage of the rated capacity.
System Output Power Factor Phs A	The system output power factor of Phase A.
System Output Power Factor Phs B	The system output power factor of Phase B.
System Output Power Factor Phs C	The system output power factor of Phase C.
System Output Power	The sum total power of all system output phases.
System Output RMS Current Phs A	The system output RMS current for Phase A.
System Output RMS Current Phs B	The system output RMS current for Phase B.
System Output RMS Current Phs C	The system output RMS current for Phase C.
System Output Voltage RMS A-B	The system output RMS voltage between Phases A and B.
System Output Voltage RMS B-C	The system output RMS voltage between Phases B and C.
System Output Voltage RMS C-A	The system output RMS voltage between Phases C and A.
System Shutdown - EPO	System shutdown due to Emergency Power Off (EPO).
System Status	The operating status for the system.
System UPS Module Count	Number of UPS modules in the system.
Time Remaining - ECO Mode	Time remaining before current active ECO Mode session stops.
Total kW Hours Saved	Total kW hours saved by ECO Mode or Intelligent Paralleling.
Total System Operating Time	The cumulative operation time of the unit.
UPS Module Type	UPS module type.
UPS Output on Bypass	The output power is supplied by the bypass.
UPS Output Source	UPS output source.
UPS System Output Source	The UPS system's output power source.
UPSC Communication Failure	The UPSC has failed to communicate in a designated time period.

Table 3.115 Liebert® EXL S1 – Glossary

Data Label	Data Description
Backfeed Breaker Open	The backfeed breaker is in the open position.
Battery Auto Test In Progress	Automatic battery test is in progress.
Battery Breaker Open	The battery circuit is open.
Battery Charging	The UPS battery is charging (battery charge percentage lower than 98).
Battery Circuit Breaker 1 Open	Battery circuit breaker 1 is open.
Battery Circuit Breaker 2 Open	Battery circuit breaker 2 is open.
Battery Circuit Breaker 3 Open	Battery circuit breaker 3 is open.
Battery Circuit Breaker 4 Open	Battery circuit breaker 4 is open.
Battery Circuit Breaker 5 Open	Battery circuit breaker 5 is open.
Battery Circuit Breaker 6 Open	Battery circuit breaker 6 is open.
Battery Circuit Breaker 7 Open	Battery circuit breaker 7 is open.
Battery Circuit Breaker 8 Open	Battery circuit breaker 8 is open.
Battery Circuit Open	Battery Circuit Open.
Battery Discharge Time	The time on battery operation for this discharge.
Battery Discharging	The battery is discharging.
Battery Ground Fault	Battery system ground fault amperage exceeds the threshold.
Battery Low	The calculated battery time remaining has reached the low battery threshold.
Battery Management System End-Of-Discharge Warning	The Battery Management System has reported an End-Of-Discharge Warning
Battery Management System Fault	The Battery Management System has reported a Fault
Battery Management System General Warning	The Battery Management System has reported a General Warning
Battery Management System Power Supply Failure	The battery management system has reported a power supply failure.
Battery Management System Rack is Offline Warning	The Battery Management System has reported a rack-is-offline warning
Battery Manual Test In Progress	Manual battery test is in progress.
Battery Percentage Charge	The percentage of battery charge.
Battery Temperature for Cabinet	The battery temperature for a cabinet.

Table 3.115 Liebert® EXL S1 – Glossary (continued)

Data Label	Data Description
Battery Test Failed	Battery test failed.
Battery Test Passed	Battery test passed
Battery Time Remaining	The calculated available time on battery.
Battery Under Voltage	Battery voltage is too low.
Battery Volts for Cabinet	The voltage between the positive and negative battery terminals of a battery cabinet.
BIB Battery Breaker Power Supply Failure	Battery Interface Board power supply has failed.
Booster Failure	Booster failure - boost is off.
Booster Fan Speed	Booster Fan Speed
Booster On/Off State	Booster on/off state.
Booster-Charger Temperature	Temperature measured at the charger stage.
Bypass Breaker (SBB) Open	The bypass circuit breaker (SBB) indicates that it is in the open position.
Bypass Breaker Closed	The bypass breaker is closed.
Bypass Input Frequency	The bypass input frequency.
Bypass Input Power Factor Phase A	The bypass input Power Factor for Phase A.
Bypass Input Power Factor Phase B	The bypass input Power Factor for Phase B.
Bypass Input Power Factor Phase C	The bypass input Power Factor for Phase C.
Bypass Input RMS Current Phase A	The bypass input RMS current for Phase A.
Bypass Input RMS Current Phase B	The bypass input RMS current for Phase B.
Bypass Input RMS Current Phase C	The bypass input RMS current for Phase C.
Bypass Input Voltage Fault	The system has detected the bypass voltage is unqualified.
Bypass Input Voltage RMS A-B	The bypass input RMS voltage between Phases A and B.
Bypass Input Voltage RMS A-N	The bypass input RMS voltage between Phase A and Neutral.
Bypass Input Voltage RMS B-C	The bypass input RMS voltage between Phases B and C.
Bypass Input Voltage RMS B-N	The bypass input RMS voltage between Phase B and Neutral.
Bypass Input Voltage RMS C-A	The bypass input RMS voltage between Phases C and A.
Bypass Input Voltage RMS C-N	The bypass input RMS voltage between Phase C and Neutral.
Bypass Not Available	A problem associated with the bypass has been detected.
Bypass out of sync	Bypass and Inverter inputs are not in sync.
Bypass Overload	Bypass overloaded, reduce load immediately.
Bypass Power Phase A	The bypass power on Phase A.
Bypass Power Phase B	The bypass power on Phase B.
Bypass Power Phase C	The bypass power on Phase C.

Table 3.115 Liebert® EXL S1 – Glossary (continued)

Data Label	Data Description
Bypass Qualification Status	bypass qualification status.
Bypass Static Switch Unavailable	The static bypass is unavailable to support the critical load.
Bypass Status	Bypass status.
Charger Failure	Charger Failure - Charger is off.
Charger On/Off State	Charger on/off state
Charger Status	Charger Status.
Circular Redundancy Status	The status of the core if the UPS is rotating the redundant core in N+1 configuration.
Critical Load GS Battery Energy Available	Battery energy (kWh) available for critical load protection. It is computed on nominal UPS power.
DC Bus Abnormal	The system has detected an abnormal DC Bus Voltage.
DC Bus Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value.
ECO Mode Operation State	This setting is used to enable or disable ECO Mode.
Equipment Over Temperature	Equipment over temperature summary event.
Fuse Failure	A summary event indicating one or more fuse failures.
General Fault	A general fault in the UPS has been detected.
General Warning	A warning in the UPS has been detected.
Ground Fault	An AC phase-to-ground fault or three-phase-fault-to-ground exists on the output of the UPS.
GS Enabled	Grid Services Enabled.
GS Grid Support Charging	Grid Support Charging.
GS Grid Support Discharging	Grid Support Discharging.
GS Grid Support	Grid Support Enabled.
GS Paused	Grid Services Paused.
GS Run from Battery for a defined time	Run from Battery for a defined time.
GS Stop Charging for a defined time	Stop Charging for a defined time.
GS Stop Charging forever	Stop Charging Forever.
GS Stopped	Grid Services Stopped.
Input Breaker Open	The main input breaker is open.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus.
Inverter Failure	Inverter failure - inverter output is off.
Inverter Overload	Inverter in overload fault
Inverter Phase A Temperature sensor	Inverter temperature sensor reading for Phase A.

Table 3.115 Liebert® EXL S1 – Glossary (continued)

Data Label	Data Description
Inverter Phase B Temperature sensor	Inverter temperature sensor reading for Phase B.
Inverter Phase C temperature sensor	Inverter temperature sensor reading for Phase C.
Inverter/Rectifier Fan Speed	Inverter/Rectifier Fan Speed
Inverter Status	Inverter status.
Inverter Synchronization Source	The reference source for inverter synchronization.
Maintenance Bypass Breaker Closed	The maintenance bypass breaker is closed.
Maintenance Isolation Breaker	Maintenance isolation breaker.
MOB Aux Sensing Fault	There was a Master Output Breaker Aux Sensing Failure
Output Apparent Power Rating	Output apparent power rating.
Output Breaker Open	The output breaker is open.
Output Off Pending	Output off pending - shutdown imminent.
Output Overload	An overload exists on the output.
Output Real Power Rating	Output real power rating
Outside Air Temperature	Ambient outside air temperature.
OverFreq GS Battery Energy Available	Battery energy (kWh) available for Grid Services under-frequency requests. It is computed on nominal UPS power.
Rectifier Failure	Rectifier failure - rectifier is off.
Rectifier off due to fan power not available	The Rectifier is off due to fan power not available
Rectifier Overcurrent Warning	The rectifier stopped for overcurrent
Rectifier Phase A Temperature sensor	Rectifier temperature sensor reading for Phase A.
Rectifier Phase B Temperature sensor	Rectifier temperature sensor reading for Phase B.
Rectifier Phase C Temperature sensor	Rectifier temperature sensor reading for Phase C.
Rectifier Status	Rectifier status.
SMPS Input Power Supply Failure	Bypass Input power supply or Rectifier input power supply has failed
SMS Stop Inverter Inhibit	When active a single inverter stop cannot be initiated.
Static Bypass Switch	Static Bypass Switch state - On/Off.
Static Switch Fan Speed	Static Switch Fan Speed
System Date and Time	The system date and time.
System Fan Failure	System fan failure - one or more fans have failed.
System Input Apparent Power Phs A	The system apparent power on phase A

Table 3.115 Liebert® EXL S1 – Glossary (continued)

Data Label	Data Description
System Input Apparent Power Phs B	The system apparent power on phase B
System Input Apparent Power Phs C	The system apparent power on phase C
System Input Black Out Count	The number of occurrences, since the last reset, where the input was not qualified to provide power to the system.
System Input Current Limit	The RMS input current has reached the input current limit threshold.
System Input Frequency	The system input frequency.
System Input Nominal Current	The nominal (or rated) system input current.
System Input Nominal Frequency	The nominal (or rated) system input frequency.
System Input Nominal Voltage	The nominal (or rated) system input voltage.
System Input Power Phase A	The system input power on Phase A.
System Input Power Phase B	The system input power on Phase B.
System Input Power Phase C	The system input power on Phase C.
System Input Power Problem	The input is not qualified to provide power to the system.
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B.
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral.
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C.
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral.
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A.
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral.
System Input RMS Current Phase A	The system input RMS current for Phase A.
System Input RMS Current Phase B	The system input RMS current for Phase B.
System Input RMS Current Phase C	The system input RMS current for Phase C.
System Load Bank Breaker	System load bank breaker.
System Output Apparent Power Phs A	System output apparent power on Phase A.
System Output Apparent Power Phs B	System output apparent power on Phase B.
System Output Apparent Power Phs C	System output apparent power on Phase C.
System Output Fault	A fault has been detected in the system output.
System Output Frequency	The system output frequency.
System Output Nominal Frequency	The nominal (or rated) system output frequency.
System Output Nominal Voltage	The nominal (or rated) system output voltage
System Output Off	The system output is off.
System Output Pct Power Phase A	The system output power on Phase A as a percentage of the rated capacity.

Table 3.115 Liebert® EXL S1 – Glossary (continued)

Data Label	Data Description
System Output Pct Power Phase B	The system output power on Phase B as a percentage of the rated capacity.
System Output Pct Power Phase C	The system output power on Phase C as a percentage of the rated capacity.
System Output Power Factor Phs A	The system output power factor of Phase A.
System Output Power Factor Phs B	The system output power factor of Phase B.
System Output Power Factor Phs C	The system output power factor of Phase C.
System Output Power Phase A	The system output power on Phase A.
System Output Power Phase B	The system output power on Phase B.
System Output Power Phase C	The system output power on Phase C.
System Output RMS Current Phs A	The system output RMS current for Phase A.
System Output RMS Current Phs B	The system output RMS current for Phase B.
System Output RMS Current Phs C	The system output RMS current for Phase C.
System Output Voltage RMS A-B	The system output RMS voltage between Phases A and B.
System Output Voltage RMS A-N	The system output RMS voltage between Phases A and Neutral.
System Output Voltage RMS B-C	The system output RMS voltage between Phases B and C.
System Output Voltage RMS B-N	The system output RMS voltage between Phases B and Neutral.
System Output Voltage RMS C-A	The system output RMS voltage between Phases C and A.
System Output Voltage RMS C-N	The system output RMS voltage between Phases C and Neutral.
System Restart Pending	A request for UPS restart has been received.
System Shutdown - EPO	System shutdown due to Emergency Power Off (EPO).
System Shutdown - Output Short	Shutdown was due to a short on the output.
System Status	The operating status for the system.
Total System Operating Time	The cumulative operation time of the unit.
Under Freq GS Battery Energy Available	Battery energy (kWh) available for Grid Services over-frequency requests. It is computed on nominal UPS power.
Unit In Special Capacity Mode	When active in a MMS, the system will always be in capacity condition, regardless of actual load.
UPS battery1 status	UPS battery status.
UPS DC input voltage	The voltage between the positive and negative terminals of the DC bus.
UPS manufacturer	The company manufacturing this specific UPS.
UPS Module Type	UPS module type.
UPS Operating Mode	UPS operating mode.
UPS Output on Bypass	The output power is supplied by the bypass.
UPS Output Source	UPS output source.

If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.					

Table 3.118 Liebert® EXM—Controller with Touchscreen HMI—Glossary

Data Label	Data Description
(Deprecated) UPS Application Mode	(Deprecated) UPS application mode. This data point has been replaced and should no longer be used.
Accumulated Discharge Time	Total accumulated discharge time for the Battery Module since it was made.
All Chargers Shutdown	All chargers in system are shut down to avoid incompatibility in external charger application, or to avoid over-charging in Lithium-ion battery application.
Application Mode For UPS	Application Mode for UPS.
Automatic Battery Test	Enable/disable the automatic battery test schedule.
Average system efficiency	Average system efficiency
Battery Auto Test In Progress	Automatic battery test is in progress
Battery Breaker 1 Open Failure	Battery circuit breaker 1 failed to open
Battery Breaker 2 Open Failure	Battery circuit breaker 2 failed to open
Battery Breaker 3 Open Failure	Battery circuit breaker 3 failed to open
Battery Breaker 4 Open Failure	Battery circuit breaker 4 failed to open
Battery Breaker 5 Open Failure	Battery circuit breaker 5 failed to open
Battery Cabinet Over Temperature	Battery Cabinet Over Temperature
Battery Capacity Low	Battery capacity is low

Table 3.118 Liebert® EXM—Controller with Touchscreen HMI—Glossary (continued)

Data Label	Data Description
Battery Charge Equalization Timeout	The battery equalizing is time out.
Battery charge status.	Battery charge status.
Battery Charging Error	The battery is not charging properly
Battery Charging Inhibited	Battery charging is inhibited due to an external inhibit signal
Battery Circuit Breaker 1 Open	Battery circuit breaker 1 is open
Battery Circuit Breaker 2 Open	Battery circuit breaker 2 is open
Battery Circuit Breaker 3 Open	Battery circuit breaker 3 is open
Battery Circuit Breaker 4 Open	Battery circuit breaker 4 is open
Battery Circuit Breaker 5 Open	Battery circuit breaker 5 is open
Battery Converter Current Limit	The battery converter has reached its maximum current limit.
Battery Converter Failure	Battery converter failure. This is a summary event caused by one or more power sub-modules in a UPS module.
Battery Discharging	The battery is discharging
Battery Equalize	The rectifier output voltage is increased to equalize the battery voltage level.
Battery Ground Fault	Battery system ground fault amperage exceeds the threshold
Battery Low	The calculated battery time remaining has reached the low battery threshold
Battery Manual Test In Progress	Manual battery test is in progress
Battery Not Qualified	The UPS battery voltage is not qualified. This event will be detected even in the absence of battery disconnect or when it is open.
Battery Over Temperature	A battery temperature sensor is reporting a value above a threshold
Battery Percentage Charge	The percentage of battery charge
Battery Room Alarm	The ambient temperature of the battery room is abnormal.
Battery Self Test Cycle Time	The time between automatic battery self test cycles.
Battery Self Test	Battery self test is in progress
Battery String Open	Battery String Open
Battery System Communication Abnormal	Battery System Communication Abnormal
Battery System Fault	Battery System Fault
Battery System Warning	Battery System Warning

Table 3.118 Liebert® EXM—Controller with Touchscreen HMI—Glossary (continued)

Data Label	Data Description
Battery Temperature for Cabinet	The battery temperature for a cabinet
Battery Temperature	The highest battery temperature among all Battery Cabinets
Battery Terminals Reversed	The measured battery voltage is a negative value due to reverse battery terminal connections.
Battery Test Failed	Battery test failed
Battery Test Passed	Battery test passed
Battery Time Remaining	The calculated available time on battery
Battery Volts for Cabinet	The voltage between the positive and negative battery terminals of a battery cabinet
Bypass - Excess Auto Retransfers	The number of auto retransfers, from bypass to inverter, has exceeded the maximum for a specified time interval
Bypass Backfeed Detected	The system detected a voltage on the bypass when none was expected
Bypass Input Frequency	The bypass input frequency
Bypass Input Voltage Fault	The system has detected the bypass voltage is unqualified.
Bypass Input Voltage RMS A-B	The bypass input RMS voltage between phases A and B
Bypass Input Voltage RMS A-N	The bypass input RMS voltage between phase A and Neutral
Bypass Input Voltage RMS B-C	The bypass input RMS voltage between phases B and C
Bypass Input Voltage RMS B-N	The bypass input RMS voltage between phase B and Neutral
Bypass Input Voltage RMS C-A	The bypass input RMS voltage between phases C and A
Bypass Input Voltage RMS C-N	The bypass input RMS voltage between phase C and Neutral
Bypass Nominal Voltage	Bypass nominal (or rated) voltage
Bypass Not Available	A problem associated with the bypass has been detected
Bypass Static Switch Unavailable	The static bypass is unavailable to support the critical load.
DC Bus Abnormal	The system has detected an abnormal DC Bus Voltage.
DC Bus Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value
DC Bus Voltage	The voltage between the positive and negative terminals of the DC bus at the battery input
ECO Mode Operation State	This setting is used to enable or disable ECO Mode.
Equipment Over Temperature	Equipment over temperature summary event
Excess ECO Suspends	Number of automatic suspensions has exceeded the ECO Mode - Maximum Auto Suspensions setting.

Table 3.118 Liebert® EXM—Controller with Touchscreen HMI—Glossary (continued)

Data Label	Data Description
External Bypass Breaker	The status of the external bypass breaker.
Hardware Mismatch	The assigned system model settings do not match the actual installed hardware. The module count is wrong, or a module of the wrong type is installed.
Inlet Air Temperature	The temperature of the inlet air
Input Breaker	Input breaker
Input Source Backfeed	The battery is backfeeding the input source.
Intelligent Parallel Operation State	This setting is used to enable or disable Intelligent Paralleling.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Inverter Failure	Inverter failure - inverter output is off
Inverter On/Off State	inverter on/off state
Inverter Relay Fault	The inverter relay has malfunctioned.
Inverter Shutdown - Overload	The inverter has shutdown due to a sustained overload
Inverter Status	Status of the inverter output. Active means the inverter is online with regulated output voltage and ready to power the load. Inactive means the inverter is offline and not ready to power the load.
LBS Active	The Load Bus Sync option is active
LBS Cable Failure	Load Bus Sync communications is abnormal. A problem with the LBS cable may exist.
LBS Inhibited	The system has detected that conditions to perform Load Bus Sync are not satisfied
Lithium-Ion Battery System Abnormal	Lithium-Ion Battery System Abnormal
Lithium-Ion Battery System Disconnect Request	A request to disconnect the Lithium-Ion battery system was received.
Lithium-Ion Battery System Status	Lithium-Ion Battery System Status
Load Impact Transfer	On bypass as result of load impact.
Load Sharing Fault	Difference between any phase inverter current of unit and the relevant average output current of parallel system is more than a specific percent of nominal current.
Loss of Redundancy	The system has an insufficient number of power modules to provide redundancy.
Loss of Synchronization	The inverter and bypass are no longer synchronized.
Low Battery Warning Time	When battery time remaining falls to, or below, this value the low battery alarm is activated.
Main Battery Disconnect Open	Main battery disconnect is open
Mains Input Neutral Lost	Loss of neutral in the input source is detected.
Maintenance Bypass Breaker	Maintenance bypass breaker
MMS Capacity Exceeded	The critical load is larger than the redundant rating of a 1+N redundant multi-module system.

Table 3.118 Liebert® EXM—Controller with Touchscreen HMI—Glossary (continued)

Data Label	Data Description
MMS Output Apparent Power	The sum total apparent power of all system output modules
MMS Output Power	The sum total power of all system output modules
MMS Overload	Multi-module system overload
MMS UPS Output Source	Multi-module UPS output source
Module Operating Status	The operating status for this Power Module.
Number Of Active Power Modules	The total number of active power modules.
Number of Discharge Cycles	The total number of battery discharge cycles for the Battery Module since it was made.
Number of Installed Power Modules	The total number of Power Modules installed.
On Generator	A generator is supplying the power to the system
Output Breaker	Output breaker
Output Current Crest Factor Phs A	Output current crest factor of Phase A.
Output Current Crest Factor Phs B	Output current crest factor of Phase B.
Output Current Crest Factor Phs C	Output current crest factor of Phase C.
Output Load on Maint. Bypass	The output power is supplied by the maintenance bypass
Output Overload	An overload exists on the output.
Parallel Cable Failure	The UPS parallel system communications is abnormal. A problem with the parallel cable may exist.
Parallel Comm Warning	Parallel communication bus warning
Power Module Balancer of DC Bus Failure	Balancer of DC Bus in the power module has failed
Power Module Bypass Input Frequency	The bypass input frequency detected by power module
Power Module Bypass Input Voltage RMS A-B	The bypass input RMS voltage between phases A and B detected by power module
Power Module Bypass Input Voltage RMS A-N	The bypass input RMS voltage between phase A and Neutral detected by power module
Power Module Bypass Input Voltage RMS B-C	The bypass input RMS voltage between phases B and C detected by power module
Power Module Bypass Input Voltage RMS B-N	The bypass input RMS voltage between phase B and Neutral detected by power module
Power Module Bypass Input Voltage RMS C-A	The bypass input RMS voltage between phases C and A detected by power module
Power Module Bypass Input Voltage RMS C-N	The bypass input RMS voltage between phase C and Neutral detected by power module

Table 3.118 Liebert® EXM—Controller with Touchscreen HMI—Glossary (continued)

Data Label	Data Description
Power Module Charger State	The status of charger in this power module in order to detect battery connection status.
Power Module Fan Fault	The Power Module has detected a fan fault.
Power Module Fuse Failure	A summary event indicating one or more fuse failures in the power module
Power Module Input Current Abnormal	Input current of the power module is abnormal
Power Module Lever Unlocked	The power module is inactive because the lever is in the unlocked position.
Power Module Over Temperature	The Power Module has detected an over temperature condition.
Power Module Power Supply Failure	Power module power supply failure
Power Module Sleep Status	Sleep status of the Power module
Rectifier Failure	Rectifier failure - rectifier is off
System Capacity	System capacity supported by the installed power modules.
System Date and Time	The system date and time
System Input Black Out Count	The number of occurrences, since the last reset, where the input was not qualified to provide power to the system
System Input Brown Out Count	The number of occurrences, since the last reset, where the system input voltage has fallen below a pre-determined threshold for a specified amount of time
System Input Frequency	The system input frequency
System Input Nominal Current	The nominal (or rated) system input current
System Input Nominal Frequency	The nominal (or rated) system input frequency
System Input Nominal Voltage	The nominal (or rated) system input voltage
System Input Phs Rotation Error	The power conductors on the input line are not wired to the UPS in the sequence preferred for the rectifier (A-B-C)
System Input Power Factor Phs A	The system input power factor for Phase A
System Input Power Factor Phs B	The system input power factor for Phase B
System Input Power Factor Phs C	The system input power factor for Phase C
System Input Power Problem	The input is not qualified to provide power to the system
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C

Table 3.118 Liebert® EXM—Controller with Touchscreen HMI—Glossary (continued)

Data Label	Data Description
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Input RMS Current Phase A	The system input RMS current for Phase A
System Input RMS Current Phase B	The system input RMS current for Phase B
System Input RMS Current Phase C	The system input RMS current for Phase C
System Output Apparent Power Phs A	System output apparent power on phase A
System Output Apparent Power Phs B	System output apparent power on phase B
System Output Apparent Power Phs C	System output apparent power on phase C
System Output Apparent Power	The sum total apparent power of all system output phases
System Output Fault	A fault has been detected in the system output
System Output Frequency	The system output frequency
System Output Nominal Frequency	The nominal (or rated) system output frequency
System Output Nominal Voltage	The nominal (or rated) system output voltage
System Output Off	The system output is off
System Output Pct Power Phase A	The system output power on phase A as a percentage of the rated capacity
System Output Pct Power Phase B	The system output power on phase B as a percentage of the rated capacity
System Output Pct Power Phase C	The system output power on phase C as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs A	The system output apparent power on phase A as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs B	The system output apparent power on phase B as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs C	The system output apparent power on phase C as a percentage of the rated capacity
System Output Power Factor Phs A	The system output power factor of phase A

Table 3.118 Liebert® EXM—Controller with Touchscreen HMI—Glossary (continued)

Data Label	Data Description
System Output Power Factor Phs B	The system output power factor of phase B
System Output Power Factor Phs C	The system output power factor of phase C
System Output Power Phase A	The system output power on phase A.
System Output Power Phase B	The system output power on phase B.
System Output Power Phase C	The system output power on phase C.
System Output Power	The sum total power of all system output phases
System Output RMS Current Phs A	The system output RMS current for Phase A
System Output RMS Current Phs B	The system output RMS current for Phase B
System Output RMS Current Phs C	The system output RMS current for Phase C
System Output Voltage RMS A-B	The system output RMS voltage between phases A and B
System Output Voltage RMS A-N	The system output RMS voltage between phases A and Neutral
System Output Voltage RMS B-C	The system output RMS voltage between phases B and C
System Output Voltage RMS B-N	The system output RMS voltage between phases B and Neutral
System Output Voltage RMS C-A	The system output RMS voltage between phases C and A
System Output Voltage RMS C-N	The system output RMS voltage between phases C and Neutral
System Set To Operate With	If this point reports 'Redundancy' then the system is configured for redundancy and the 'Loss of Redundancy' alarm is enabled.
System Shutdown - EPO	System shutdown due to Emergency Power Off (EPO)
System Status	The operating status for the system
Time Until Next Auto Battery Test	The time until the next automatic battery test is started.
Top Outlet Fan Fault	Top outlet fan fault - one or more top outlet fans have failed.
Total System Operating Time	The cumulative operation time of the unit
Transfer to Bypass - System Overload	The UPS System has transferred to bypass because the active power modules cannot support the critical load.

Table 3.118 Liebert® EXM—Controller with Touchscreen HMI—Glossary (continued)

Data Label	Data Description
UPS Battery Status	UPS battery status
UPS Output on Bypass	The output power is supplied by the bypass
UPS Output Source	UPS output source
User Operation Invalid	User attempted an invalid operation.

Table 3.121 Liebert® EXM—Controller with Touchscreen HMI—Glossary

Data Label	Data Description
(Deprecated) UPS Application Mode	(Deprecated) UPS application mode. This data point has been replaced and should no longer be used.
Accumulated Discharge Time	Total accumulated discharge time for the Battery Module since it was made.
Application Mode For UPS	Application Mode for UPS.
Automatic Battery Test	Enable/disable the automatic battery test schedule.
Average system efficiency	Average system efficiency.
Battery Auto Test In Progress	Automatic battery test is in progress.
Battery Breaker 1 Open Failure	Battery circuit breaker 1 failed to open.
Battery Breaker 2 Open Failure	Battery circuit breaker 2 failed to open.
Battery Breaker 3 Open Failure	Battery circuit breaker 3 failed to open.
Battery Breaker 4 Open Failure	Battery circuit breaker 4 failed to open.
Battery Capacity Low	Battery capacity is low.
Battery Charge Equalization Timeout	The battery equalizing is time out.
Battery charge status.	Battery charge status.
Battery Charging Error	The battery is not charging properly.
Battery Charging Inhibited	Battery charging is inhibited due to an external inhibit signal.

Table 3.121 Liebert® EXM—Controller with Touchscreen HMI—Glossary (continued)

Data Label	Data Description
Battery Circuit Breaker 1 Open	Battery circuit breaker 1 is open.
Battery Circuit Breaker 2 Open	Battery circuit breaker 2 is open.
Battery Circuit Breaker 3 Open	Battery circuit breaker 3 is open.
Battery Circuit Breaker 4 Open	Battery circuit breaker 4 is open.
Battery Converter Current Limit	The battery converter has reached its maximum current limit.
Battery Converter Failure	Battery converter failure. This is a summary event caused by one or more power sub-modules in a UPS module.
Battery Discharging	The battery is discharging.
Battery Equalize	The rectifier output voltage is increased to equalize the battery voltage level.
Battery Ground Fault	Battery system ground fault amperage exceeds the threshold
Battery Low	The calculated battery time remaining has reached the low battery threshold.
Battery Manual Test In Progress	Manual battery test is in progress
Battery Not Qualified	The UPS battery voltage is not qualified. This event will be detected even in the absence of battery disconnect or when it is open.
Battery Over Temperature	A battery temperature sensor is reporting a value above a threshold.
Battery Percentage Charge	The percentage of battery charge.
Battery Room Alarm	The ambient temperature of the battery room is abnormal.
Battery Self Test Cycle Time	The time between automatic battery self test cycles.
Battery Self Test	Battery self test is in progress.
Battery Temperature for Cabinet	The battery temperature for a cabinet.
Battery Temperature	The highest battery temperature among all Battery Cabinets.
Battery Terminals Reversed	The measured battery voltage is a negative value due to reverse battery terminal connections.
Battery Test Failed	Battery test failed.
Battery Test Passed	Battery test passed.
Battery Time Remaining	The calculated available time on battery.
Battery Volts for Cabinet	The voltage between the positive and negative battery terminals of a battery cabinet.
Bypass - Excess Auto Retransfers	The number of auto retransfers, from bypass to inverter, has exceeded the maximum for a specified time interval.
Bypass Backfeed Detected	The system detected a voltage on the bypass when none was expected.
Bypass Input Frequency	The bypass input frequency.

Table 3.121 Liebert® EXM—Controller with Touchscreen HMI—Glossary (continued)

Data Label	Data Description
Bypass Input Voltage Fault	The system has detected the bypass voltage is unqualified.
Bypass Input Voltage RMS A-B	The bypass input RMS voltage between Phases A and B.
Bypass Input Voltage RMS A-N	The bypass input RMS voltage between Phase A and Neutral.
Bypass Input Voltage RMS B-C	The bypass input RMS voltage between Phases B and C.
Bypass Input Voltage RMS B-N	The bypass input RMS voltage between Phase B and Neutral.
Bypass Input Voltage RMS C-A	The bypass input RMS voltage between Phases C and A.
Bypass Input Voltage RMS C-N	The bypass input RMS voltage between Phase C and Neutral.
Bypass Nominal Voltage	Bypass nominal (or rated) voltage.
Bypass Not Available	A problem associated with the bypass has been detected.
Bypass Static Switch Unavailable	The static bypass is unavailable to support the critical load.
DC Bus Abnormal	The system has detected an abnormal DC Bus Voltage.
DC Bus Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value.
DC Bus Voltage	The voltage between the positive and negative terminals of the DC bus at the battery input.
ECO Mode Operation State	This setting is used to enable or disable ECO Mode.
Equipment Over Temperature	Equipment over temperature summary event.
Excess ECO Suspends	Number of automatic suspensions has exceeded the ECO Mode - Maximum Auto Suspensions setting.
External Bypass Breaker	The status of the external bypass breaker.
Hardware Mismatch	The assigned system model settings do not match the actual installed hardware. The module count is wrong, or a module of the wrong type is installed.
Inlet Air Temperature	The temperature of the inlet air.
Input Breaker	Input breaker
Input Source Backfeed	The battery is backfeeding the input source.
Intelligent Parallel Operation State	This setting is used to enable or disable Intelligent Paralleling.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus.
Inverter Failure	Inverter failure - inverter output is off.
Inverter On/Off State	Inverter on/off state.

Table 3.121 Liebert® EXM—Controller with Touchscreen HMI—Glossary (continued)

Data Label	Data Description
Inverter Relay Fault	The inverter relay has malfunctioned.
Inverter Shutdown - Overload	The inverter has shutdown due to a sustained overload.
Inverter Status	Status of the inverter output. Active means the inverter is online with regulated output voltage and ready to power the load. Inactive means the inverter is offline and not ready to power the load.
LBS Active	The Load Bus Sync option is active.
LBS Cable Failure	Load Bus Sync communications is abnormal. A problem with the LBS cable may exist.
LBS Inhibited	The system has detected that conditions to perform Load Bus Sync are not satisfied.
Lithium-Ion Battery System Abnormal	Lithium-Ion Battery System Abnormal.
Lithium-Ion Battery System Disconnect Request	A request to disconnect the Lithium-Ion battery system was received.
Lithium-Ion Battery System Status	Lithium-Ion Battery System Status.
Load Impact Transfer	On bypass as result of load impact.
Load Sharing Fault	Difference between any phase inverter current of unit and the relevant average output current of parallel system is more than a specific percent of nominal current.
Loss of Redundancy	The system has an insufficient number of power modules to provide redundancy.
Loss of Synchronization	The inverter and bypass are no longer synchronized.
Low Battery Warning Time	When battery time remaining falls to, or below, this value the low battery alarm is activated.
Main Battery Disconnect Open	Main battery disconnect is open.
Mains Input Neutral Lost	Loss of neutral in the input source is detected.
Maintenance Bypass Breaker	Maintenance bypass breaker.
MMS Capacity Exceeded	The critical load is larger than the redundant rating of a 1+N redundant multi-module system.
MMS Output Apparent Power	The sum total apparent power of all system output modules.
MMS Output Power	The sum total power of all system output modules.
MMS Overload	Multi-module system overload.
MMS UPS Output Source	Multi-module UPS output source.
Module Operating Status	The operating status for this Power Module.
Number Of Active Power Modules	The total number of active power modules.
Number of Discharge Cycles	The total number of battery discharge cycles for the Battery Module since it was made.
Number of Installed Power Modules	The total number of Power Modules installed.
On Generator	A generator is supplying the power to the system.
Output Breaker	Output breaker.

Table 3.121 Liebert® EXM—Controller with Touchscreen HMI—Glossary (continued)

Data Label	Data Description
Output Current Crest Factor Phs A	Output current crest factor of Phase A.
Output Current Crest Factor Phs B	Output current crest factor of Phase B.
Output Current Crest Factor Phs C	Output current crest factor of Phase C.
Output Load on Maint. Bypass	The output power is supplied by the maintenance bypass.
Output Overload	An overload exists on the output.
Parallel Cable Failure	The UPS parallel system communications is abnormal. A problem with the parallel cable may exist.
Parallel Comm Warning	Parallel communication bus warning.
Power Module Balancer of DC Bus Failure	Balancer of DC Bus in the power module has failed.
Power Module Bypass Input Frequency	The bypass input frequency detected by power module.
Power Module Bypass Input Voltage RMS A-B	The bypass input RMS voltage between Phases A and B detected by power module.
Power Module Bypass Input Voltage RMS A-N	The bypass input RMS voltage between Phase A and Neutral detected by power module.
Power Module Bypass Input Voltage RMS B-C	The bypass input RMS voltage between Phases B and C detected by power module.
Power Module Bypass Input Voltage RMS B-N	The bypass input RMS voltage between Phase B and Neutral detected by power module.
Power Module Bypass Input Voltage RMS C-A	The bypass input RMS voltage between Phases C and A detected by power module.
Power Module Bypass Input Voltage RMS C-N	The bypass input RMS voltage between Phase C and Neutral detected by power module.
Power Module Fan Fault	The Power Module has detected a fan fault.
Power Module Fuse Failure	A summary event indicating one or more fuse failures in the power module.
Power Module Input Current Abnormal	Input current of the power module is abnormal.
Power Module Lever Unlocked	The power module is inactive because the lever is in the unlocked position.
Power Module Over Temperature	The Power Module has detected an over temperature condition.
Power Module Power Supply Failure	Power module power supply failure.
Power Module Sleep Status	Sleep status of the Power Module.
Rectifier Failure	Rectifier failure - rectifier is off.

Table 3.121 Liebert® EXM—Controller with Touchscreen HMI—Glossary (continued)

Data Label	Data Description
System Capacity	System capacity supported by the installed power modules.
System Date and Time	The system date and time.
System Input Black Out Count	The number of occurrences, since the last reset, where the input was not qualified to provide power to the system.
System Input Brown Out Count	The number of occurrences, since the last reset, where the system input voltage has fallen below a pre-determined threshold for a specified amount of time.
System Input Frequency	The system input frequency.
System Input Nominal Current	The nominal (or rated) system input current.
System Input Nominal Frequency	The nominal (or rated) system input frequency.
System Input Nominal Voltage	The nominal (or rated) system input voltage.
System Input Phs Rotation Error	The power conductors on the input line are not wired to the UPS in the sequence preferred for the rectifier (A-B-C).
System Input Power Factor Phs A	The system input power factor for Phase A.
System Input Power Factor Phs B	The system input power factor for Phase B.
System Input Power Factor Phs C	The system input power factor for Phase C.
System Input Power Problem	The input is not qualified to provide power to the system.
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B.
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral.
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C.
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral.
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A.
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral.
System Input RMS Current Phase A	The system input RMS current for Phase A.
System Input RMS Current Phase B	The system input RMS current for Phase B.
System Input RMS Current Phase C	The system input RMS current for Phase C.
System Output Apparent Power Phs A	System output apparent power on Phase A.
System Output Apparent Power Phs B	System output apparent power on Phase B.

Table 3.121 Liebert® EXM—Controller with Touchscreen HMI—Glossary (continued)

Data Label	Data Description
System Output Apparent Power Phs C	System output apparent power on Phase C.
System Output Apparent Power	The sum total apparent power of all system output phases.
System Output Fault	A fault has been detected in the system output.
System Output Frequency	The system output frequency.
System Output Nominal Frequency	The nominal (or rated) system output frequency.
System Output Nominal Voltage	The nominal (or rated) system output voltage.
System Output Off	The system output is off.
System Output Pct Power Phase A	The system output power on Phase A as a percentage of the rated capacity.
System Output Pct Power Phase B	The system output power on Phase B as a percentage of the rated capacity.
System Output Pct Power Phase C	The system output power on Phase C as a percentage of the rated capacity.
System Output Pct Pwr (VA) Phs A	The system output apparent power on Phase A as a percentage of the rated capacity.
System Output Pct Pwr (VA) Phs B	The system output apparent power on Phase B as a percentage of the rated capacity.
System Output Pct Pwr (VA) Phs C	The system output apparent power on Phase C as a percentage of the rated capacity.
System Output Power Factor Phs A	The system output power factor of Phase A.
System Output Power Factor Phs B	The system output power factor of Phase B.
System Output Power Factor Phs C	The system output power factor of Phase C.
System Output Power Phase A	The system output power on Phase A.
System Output Power Phase B	The system output power on Phase B.
System Output Power Phase C	The system output power on Phase C.
System Output Power	The sum total power of all system output Phases.
System Output RMS Current Phs A	The system output RMS current for Phase A.
System Output RMS Current Phs B	The system output RMS current for Phase B.

Table 3.121 Liebert® EXM—Controller with Touchscreen HMI—Glossary (continued)

Data Label	Data Description
System Output RMS Current Phs C	The system output RMS current for Phase C.
System Output Voltage RMS A-B	The system output RMS voltage between Phases A and B.
System Output Voltage RMS A-N	The system output RMS voltage between Phases A and Neutral.
System Output Voltage RMS B-C	The system output RMS voltage between Phases B and C.
System Output Voltage RMS B-N	The system output RMS voltage between Phases B and Neutral.
System Output Voltage RMS C-A	The system output RMS voltage between Phases C and A.
System Output Voltage RMS C-N	The system output RMS voltage between Phases C and Neutral.
System Set To Operate With	If this point reports 'Redundancy' then the system is configured for redundancy and the 'Loss of Redundancy' alarm is enabled.
System Shutdown - EPO	System shutdown due to Emergency Power Off (EPO).
System Status	The operating status for the system.
Time Until Next Auto Battery Test	The time until the next automatic battery test is started.
Top Outlet Fan Fault	Top outlet fan fault - one or more top outlet fans have failed.
Total System Operating Time	The cumulative operation time of the unit.
Transfer to Bypass - System Overload	The UPS System has transferred to bypass because the active power modules cannot support the critical load.
UPS Battery Status	UPS battery status.
UPS Output on Bypass	The output power is supplied by the bypass.
UPS Output Source	UPS output source.
User Operation Invalid	User attempted an invalid operation.

Table 3.122 Liebert® EXM2/APM Plus—Status and Coil

Data Label	Status	Coil	Number of Bits	Notes
Input				
Mains Input Neutral Lost	10001		1	Active on Alarm

System Date and Time	39998	49998	2		Units : Secs since Epoch(UTC)

Table 3.124 Liebert®EXM2/APM Plus—Glossary

Data Label	Data Description
Accumulated Discharge Time	Total accumulated discharge time for the Battery Module since it was made.
Application Mode For UPS	Application Mode for UPS.
Automatic Battery Test	Enable/disable the automatic battery test schedule.
Average system efficiency	Average system efficiency
Battery Auto Test In Progress	Automatic battery test is in progress
Battery Breaker 1 Open Failure	Battery circuit breaker 1 failed to open
Battery Capacity Low	Battery capacity is low
Battery Charge Equalization Timeout	The battery equalizing is time out.
Battery Charge Status	Battery charge status.
Battery Charging Error	The battery is not charging properly

Table 3.124 Liebert®EXM2/APM Plus—Glossary (continued)

Data Label	Data Description
Battery Charging Inhibited	Battery charging is inhibited due to an external inhibit signal
Battery Circuit Breaker 1 Open	Battery circuit breaker 1 is open
Battery Converter Current Limit	The battery converter has reached its maximum current limit.
Battery Converter Failure	Battery converter failure. This is a summary event caused by one or more power sub-modules in a UPS module.
Battery Discharging	The battery is discharging
Battery Equalize	The rectifier output voltage is increased to equalize the battery voltage level.
Battery Ground Fault	Battery system ground fault amperage exceeds the threshold
Battery Low	The calculated battery time remaining has reached the low battery threshold
Battery Management System Fault	The Battery Management System has reported a Fault
Battery Management System General Warning	The Battery Management System has reported a General Warning
Battery Management System Rack is Offline Warning	The Battery Management System has reported a rack-is-offline warning
Battery Manual Test In Progress	Manual battery test is in progress
Battery Not Qualified	The UPS battery voltage is not qualified. This event will be detected even in the absence of battery disconnect or when it is open.
Battery Over Temperature	A battery temperature sensor is reporting a value above a threshold
Battery Over Voltage	The system has detected that the battery voltage has exceeded a predetermined limit.
Battery Percentage Charge	The percentage of battery charge
Battery Room Alarm	The ambient temperature of the battery room is abnormal.
Battery Self Test Cycle Time	The time between automatic battery self test cycles.
Battery Self Test	Battery self test is in progress
Battery System Communication Abnormal	Battery System Communication Abnormal
Battery System Fault	Battery System Fault
Battery System Warning	Battery System Warning
Battery Temp Abnormal	Battery temperature is abnormal.
Battery Temperature for Cabinet	The battery temperature for a cabinet
Battery Temperature	The highest battery temperature among all Battery Cabinets
Battery Terminals Reversed	The measured battery voltage is a negative value due to reverse battery terminal connections.
Battery Test Failed	Battery test failed
Battery Time Remaining	The calculated available time on battery
Battery Volts for Cabinet	The voltage between the positive and negative battery terminals of a battery cabinet

Table 3.124 Liebert®EXM2/APM Plus—Glossary (continued)

Data Label	Data Description
Bypass - Excess Auto Retransfers	The number of auto retransfers, from bypass to inverter, has exceeded the maximum for a specified time interval
Bypass Apparent Power Phase A	The bypass apparent power on phase A
Bypass Apparent Power Phase B	The bypass apparent power on phase B
Bypass Apparent Power Phase C	The bypass apparent power on phase C
Bypass Backfeed Detected	The system detected a voltage on the bypass when none was expected
Bypass Control Module Not Available	The bypass control module is not available.
Bypass controlling the SCR autonomously	The bypass is controlling the SCR autonomously because not all inverters are online.
Bypass Input Frequency	The bypass input frequency
Bypass Input Voltage RMS A-B	The bypass input RMS voltage between phases A and B
Bypass Input Voltage RMS A-N	The bypass input RMS voltage between phase A and Neutral
Bypass Input Voltage RMS B-C	The bypass input RMS voltage between phases B and C
Bypass Input Voltage RMS B-N	The bypass input RMS voltage between phase B and Neutral
Bypass Input Voltage RMS C-A	The bypass input RMS voltage between phases C and A
Bypass Input Voltage RMS C-N	The bypass input RMS voltage between phase C and Neutral
Bypass Module Not Available	The bypass module is not available.
Bypass Nominal Voltage	Bypass nominal (or rated) voltage
Bypass Not Available	A problem associated with the bypass has been detected
Bypass Power Phase A	The bypass power on phase A
Bypass Power Phase B	The bypass power on phase B
Bypass Power Phase C	The bypass power on phase C
Bypass Static Switch Unavailable	The static bypass is unavailable to support the critical load.
Bypass Unable to Trace	The voltage amplitude or frequency of bypass is out of the range of trace.
DC Bus Abnormal	The system has detected an abnormal DC Bus Voltage.
DC Bus Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value
DC Bus Voltage	The voltage between the positive and negative terminals of the DC bus at the battery input
Discharger Shutdown	A condition is present that prevents the Battery Discharger from working.
ECO mode Inhibited	ECO mode is inhibited due to an external inhibit signal.

Table 3.124 Liebert®EXM2/APM Plus—Glossary (continued)

Data Label	Data Description
ECO Suspended Time Remaining	The time remaining before ECO mode is activated.
Equipment Over Temperature	Equipment over temperature summary event
Excess ECO Suspends	Number of automatic suspensions has exceeded the ECO Mode - Maximum Auto Suspensions setting.
Fuse Failure	A summary event indicating one or more fuse failures
Ground Fault	An AC phase to ground fault or three phase fault to ground exists on the output of the UPS.
Hardware Mismatch	The assigned system model settings do not match the actual installed hardware. The module count is wrong, or a module of the wrong type is installed.
Inlet Air Temperature	The temperature of the inlet air
Input Breaker	Input breaker
Input Source Backfeed	The battery is backfeeding the input source.
Internal Bypass Breaker	Internal bypass breaker
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Inverter Failure	Inverter failure - inverter output is off
Inverter On/Off State	inverter on/off state
Inverter Relay Fault	The inverter relay has malfunctioned.
Inverter Shutdown - Overload	The inverter has shutdown due to a sustained overload
Inverter Status	Status of the inverter output. Active means the inverter is online with regulated output voltage and ready to power the load. Inactive means the inverter is offline and not ready to power the load.
Inverter Transfer Inhibit - Ext	Transfer of critical bus source to inverter is inhibited by an external signal
LBS Active	The Load Bus Sync option is active
LBS Cable Failure	Load Bus Sync communications is abnormal. A problem with the LBS cable may exist.
LBS Inhibited	The system has detected that conditions to perform Load Bus Sync are not satisfied
Load Impact Transfer	On bypass as result of load impact.
Load Sharing Fault	Difference between any phase inverter current of unit and the relevant average output current of parallel system is more than a specific percent of nominal current.
Loss of Redundancy	The system has an insufficient number of power modules to provide redundancy.
Loss of Synchronization	The inverter and bypass are no longer synchronized.
Low Battery Warning Time	When battery time remaining falls to, or below, this value the low battery alarm is activated.
Mains Input Neutral Lost	Loss of neutral in the input source is detected.
Maintenance Bypass Breaker	Maintenance bypass breaker
MMS Capacity Exceeded	The critical load is larger than the redundant rating of a 1+N redundant multi-module system.
MMS Output Apparent Power	The sum total apparent power of all system output modules

Table 3.124 Liebert®EXM2/APM Plus—Glossary (continued)

Data Label	Data Description
MMS Output Power	The sum total power of all system output modules
MMS UPS Output Source	Multi-module UPS output source
Module Operating Status	The operating status for this Power Module.
Negative DC Bus Voltage	The voltage between the negative terminals of the DC bus and neutral line.
Number Of Active Power Modules	The total number of active power modules.
Number of Discharge Cycles	The total number of battery discharge cycles for the Battery Module since it was made.
Number of Installed Power Modules	The total number of Power Modules installed.
On Generator	A generator is supplying the power to the system
Output Breaker Open	UPS internal or external output breaker is open.
Output Breaker	Output breaker
Output Current Crest Factor Phs A	Output current crest factor of Phase A.
Output Current Crest Factor Phs B	Output current crest factor of Phase B.
Output Current Crest Factor Phs C	Output current crest factor of Phase C.
Output Disabled	Output Disabled
Output Load on Maint. Bypass	The output power is supplied by the maintenance bypass
Output Overload	An overload exists on the output.
Parallel Cable Failure	The UPS parallel system communications is abnormal. A problem with the parallel cable may exist.
Parallel Comm Warning	Parallel communication bus warning
Parameter Configuration Failed	Parameter configuration failed
Positive DC Bus Voltage	The voltage between the positive terminals of the DC bus and neutral line.
Power Module Balancer of DC Bus Failure	Balancer of DC Bus in the power module has failed
Power Module Communication status	The control has detected a power module communication failure.
Power Module Fan Fault	The Power Module has detected a fan fault.
Power Module Fuse Failure	A summary event indicating one or more fuse failures in the power module
Power Module Input Current Abnormal	Input current of the power module is abnormal
Power Module Input Current High	Input current of the power module is over limit.
Power Module Lever Unlocked	The power module is inactive because the lever is in the unlocked position.

Table 3.124 Liebert®EXM2/APM Plus—Glossary (continued)

Data Label	Data Description
Power Module Over Temperature	The Power Module has detected an over temperature condition.
Power Module Power Supply Failure	Power module power supply failure
Power Module Ready Status	Status of the inverter. Active means the inverter is ready to power the load. Inactive means the inverter is not ready to power the load.
Power Module Sleep Status	Sleep status of the Power module
Rectifier Failure	Rectifier failure - rectifier is off
System Capacity	System capacity supported by the installed power modules.
System Date and Time	The system date and time
System Fan Failure	System fan failure - one or more fans have failed
System Input Apparent Power Phs A	The system apparent power on phase A
System Input Apparent Power Phs B	The system apparent power on phase B
System Input Apparent Power Phs C	The system apparent power on phase C
System Input Black Out Count	The number of occurrences, since the last reset, where the input was not qualified to provide power to the system
System Input Brown Out Count	The number of occurrences, since the last reset, where the system input voltage has fallen below a pre-determined threshold for a specified amount of time
System Input Frequency	The system input frequency
System Input Nominal Current	The nominal (or rated) system input current
System Input Nominal Voltage	The nominal (or rated) system input voltage
System Input Phs Rotation Error	The power conductors on the input line are not wired to the UPS in the sequence preferred for the rectifier (A-B-C)
System Input Power Factor Phs A	The system input power factor for Phase A
System Input Power Factor Phs B	The system input power factor for Phase B
System Input Power Factor Phs C	The system input power factor for Phase C
System Input Power Phase A	The system input power on phase A
System Input Power Phase B	The system input power on phase B
System Input Power Phase C	The system input power on phase C
System Input Power Problem	The input is not qualified to provide power to the system
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral

Table 3.124 Liebert®EXM2/APM Plus—Glossary (continued)

Data Label	Data Description
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Input RMS Current Phase A	The system input RMS current for Phase A
System Input RMS Current Phase B	The system input RMS current for Phase B
System Input RMS Current Phase C	The system input RMS current for Phase C
System Output Apparent Power Phs A	System output apparent power on phase A
System Output Apparent Power Phs B	System output apparent power on phase B
System Output Apparent Power Phs C	System output apparent power on phase C
System Output Apparent Power	The sum total apparent power of all system output phases
System Output Fault	A fault has been detected in the system output
System Output Frequency	The system output frequency
System Output Nominal Frequency	The nominal (or rated) system output frequency
System Output Nominal Voltage	The nominal (or rated) system output voltage
System Output Off	The system output is off
System Output Pct Power Phase A	The system output power on phase A as a percentage of the rated capacity
System Output Pct Power Phase B	The system output power on phase B as a percentage of the rated capacity
System Output Pct Power Phase C	The system output power on phase C as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs A	The system output apparent power on phase A as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs B	The system output apparent power on phase B as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs C	The system output apparent power on phase C as a percentage of the rated capacity
System Output Power Factor Phs A	The system output power factor of phase A

Table 3.124 Liebert®EXM2/APM Plus—Glossary (continued)

Data Label	Data Description
System Output Power Factor Phs B	The system output power factor of phase B
System Output Power Factor Phs C	The system output power factor of phase C
System Output Power Phase A	The system output power on phase A.
System Output Power Phase B	The system output power on phase B.
System Output Power Phase C	The system output power on phase C.
System Output Power	The sum total power of all system output phases
System Output RMS Current Phs A	The system output RMS current for Phase A
System Output RMS Current Phs B	The system output RMS current for Phase B
System Output RMS Current Phs C	The system output RMS current for Phase C
System Output Voltage RMS A-B	The system output RMS voltage between phases A and B
System Output Voltage RMS A-N	The system output RMS voltage between phases A and Neutral
System Output Voltage RMS B-C	The system output RMS voltage between phases B and C
System Output Voltage RMS B-N	The system output RMS voltage between phases B and Neutral
System Output Voltage RMS C-A	The system output RMS voltage between phases C and A
System Output Voltage RMS C-N	The system output RMS voltage between phases C and Neutral
System Set To Operate With	If this point reports 'Redundancy' then the system is configured for redundancy and the 'Loss of Redundancy' alarm is enabled.
System Shutdown - EPO	System shutdown due to Emergency Power Off (EPO)
System Status	The operating status for the system
Time Until Next Auto Battery Test	The time until the next automatic battery test is started.
Top Outlet Fan Fault	Top outlet fan fault - one or more top outlet fans have failed.
Total System Operating Time	The cumulative operation time of the unit
Transfer to Bypass - System Overload	The UPS System has transferred to bypass because the active power modules cannot support the critical load.
UPS Battery Status	UPS battery status

Table 3.124 Liebert®EXM2/APM Plus—Glossary (continued)

Data Label	Data Description
UPS Output on Bypass	The output power is supplied by the bypass
UPS Output Source	UPS output source
User Operation Invalid	User attempted an invalid operation.

Table 3.125 Liebert® EXS Frame 2/3—Status and Coil

Data Label	Status	Coil	Number of Bits	Notes

Table 3.127 Liebert® EXS Frame 2/3—Glossary

Data Label	Data Description
Accumulated Discharge Time	Total accumulated discharge time for the Battery Module since it was made.
Application Mode For UPS	Application Mode for UPS.
Automatic Battery Test	Enable/disable the automatic battery test schedule.
Average system efficiency	Average system efficiency
Battery Auto Test In Progress	Automatic battery test is in progress
Battery Breaker 1 Open Failure	Battery circuit breaker 1 failed to open

Table 3.127 Liebert® EXS Frame 2/3—Glossary (continued)

Data Label	Data Description
Battery Capacity Low	Battery capacity is low
Battery Charge Equalization Timeout	The battery equalizing is time out.
Battery charge status.	Battery charge status.
Battery Charging Error	The battery is not charging properly
Battery Charging Inhibited	Battery charging is inhibited due to an external inhibit signal
Battery Circuit Breaker 1 Open	Battery circuit breaker 1 is open
Battery Converter Current Limit	The battery converter has reached its maximum current limit.
Battery Converter Failure	Battery converter failure. This is a summary event caused by one or more power sub-modules in a UPS module.
Battery Deep Discharge	UPS depleted the batteries to the end of discharge(EOD) voltage
Battery Discharging	The battery is discharging
Battery Equalize	The rectifier output voltage is increased to equalize the battery voltage level.
Battery Ground Fault	Battery system ground fault amperage exceeds the threshold
Battery Low	The calculated battery time remaining has reached the low battery threshold
Battery Manual Test In Progress	Manual battery test is in progress
Battery Not Qualified	The UPS battery voltage is not qualified. This event will be detected even in the absence of battery disconnect or when it is open.
Battery Over Temperature	A battery temperature sensor is reporting a value above a threshold
Battery Percentage Charge	The percentage of battery charge
Battery Self Test Cycle Time	The time between automatic battery self test cycles.
Battery Self Test	Battery self test is in progress
Battery Temperature for Cabinet	The battery temperature for a cabinet
Battery Temperature	The highest battery temperature among all Battery Cabinets
Battery Terminals Reversed	The measured battery voltage is a negative value due to reverse battery terminal connections.
Battery Test Failed	Battery test failed
Battery Time Remaining	The calculated available time on battery
Battery Volts for Cabinet	The voltage between the positive and negative battery terminals of a battery cabinet
Bypass - Excess Auto Retransfers	The number of auto retransfers, from bypass to inverter, has exceeded the maximum for a specified time interval
Bypass Backfeed Detected	The system detected a voltage on the bypass when none was expected
Bypass Input Frequency	The bypass input frequency

Table 3.127 Liebert® EXS Frame 2/3—Glossary (continued)

Data Label	Data Description
Bypass Input Voltage Fault	The system has detected the bypass voltage is unqualified.
Bypass Input Voltage RMS A-B	The bypass input RMS voltage between phases A and B
Bypass Input Voltage RMS A-N	The bypass input RMS voltage between phase A and Neutral
Bypass Input Voltage RMS B-C	The bypass input RMS voltage between phases B and C
Bypass Input Voltage RMS B-N	The bypass input RMS voltage between phase B and Neutral
Bypass Input Voltage RMS C-A	The bypass input RMS voltage between phases C and A
Bypass Input Voltage RMS C-N	The bypass input RMS voltage between phase C and Neutral
Bypass Nominal Voltage	Bypass nominal (or rated) voltage
Bypass Not Available	A problem associated with the bypass has been detected
Bypass Static Switch Unavailable	The static bypass is unavailable to support the critical load.
DC Bus Abnormal	The system has detected an abnormal DC Bus Voltage.
DC Bus Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value
DC Bus Voltage	The voltage between the positive and negative terminals of the DC bus at the battery input
Equipment Over Temperature	Equipment over temperature summary event
Excess ECO Suspends	Number of automatic suspensions has exceeded the ECO Mode - Maximum Auto Suspensions setting.
Ground Fault	An AC phase to ground fault or three phase fault to ground exists on the output of the UPS.
Hardware Mismatch	The assigned system model settings do not match the actual installed hardware. The module count is wrong, or a module of the wrong type is installed.
Input Breaker	Input breaker
Input Source Backfeed	The battery is backfeeding the input source.
Intelligent Parallel Operation State	This setting is used to enable or disable Intelligent Paralleling.
Internal Bypass Breaker	Internal bypass breaker
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Inverter Failure	Inverter failure - inverter output is off
Inverter On/Off State	inverter on/off state
Inverter Relay Fault	The inverter relay has malfunctioned.

Table 3.127 Liebert® EXS Frame 2/3—Glossary (continued)

Data Label	Data Description
Inverter Shutdown - Overload	The inverter has shutdown due to a sustained overload
LBS Active	The Load Bus Sync option is active
LBS Inhibited	The system has detected that conditions to perform Load Bus Sync are not satisfied
Load Impact Transfer	On bypass as result of load impact.
Load Sharing Fault	Difference between any phase inverter current of unit and the relevant average output current of parallel system is more than a specific percent of nominal current.
Loss of Redundancy	The system has an insufficient number of power modules to provide redundancy.
Loss of Synchronization	The inverter and bypass are no longer synchronized.
Low Battery Warning Time	When battery time remaining falls to, or below, this value the low battery alarm is activated.
Mains Input Neutral Lost	Loss of neutral in the input source is detected.
Maintenance Bypass Breaker	Maintenance bypass breaker
MMS Capacity Exceeded	The critical load is larger than the redundant rating of a 1+N redundant multi-module system.
MMS Output Apparent Power	The sum total apparent power of all system output modules
MMS Output Power	The sum total power of all system output modules
MMS Overload	Multi-module system overload
MMS UPS Output Source	Multi-module UPS output source
Number Of Active Power Modules	The total number of active power modules.
Number of Discharge Cycles	The total number of battery discharge cycles for the Battery Module since it was made.
Number of Installed Power Modules	The total number of Power Modules installed.
On Generator	A generator is supplying the power to the system
Output Breaker	Output breaker
Output Current Crest Factor Phs A	Output current crest factor of Phase A.
Output Current Crest Factor Phs B	Output current crest factor of Phase B.
Output Current Crest Factor Phs C	Output current crest factor of Phase C.
Output Load on Maint. Bypass	The output power is supplied by the maintenance bypass
Output Overload	An overload exists on the output.
Power Module Fan Fault	The Power Module has detected a fan fault.

Table 3.127 Liebert® EXS Frame 2/3—Glossary (continued)

Data Label	Data Description
Power Module Fuse Failure	A summary event indicating one or more fuse failures in the power module
Power Module Input Current Abnormal	Input current of the power module is abnormal
Power Module Over Temperature	The Power Module has detected an over temperature condition.
Power Module Power Supply Failure	Power module power supply failure
Power Module Sleep Status	Sleep status of the Power module
Rectifier Failure	Rectifier failure - rectifier is off
System Capacity	System capacity supported by the installed power modules.
System Date and Time	The system date and time
System Fan Failure	System fan failure - one or more fans have failed
System Input Black Out Count	The number of occurrences, since the last reset, where the input was not qualified to provide power to the system
System Input Brown Out Count	The number of occurrences, since the last reset, where the system input voltage has fallen below a pre-determined threshold for a specified amount of time
System Input Current Limit	The RMS input current has reached the input current limit threshold
System Input Frequency	The system input frequency
System Input Nominal Current	The nominal (or rated) system input current
System Input Nominal Frequency	The nominal (or rated) system input frequency
System Input Nominal Voltage	The nominal (or rated) system input voltage
System Input Phs Rotation Error	The power conductors on the input line are not wired to the UPS in the sequence preferred for the rectifier (A-B-C)
System Input Power Factor Phs A	The system input power factor for Phase A
System Input Power Factor Phs B	The system input power factor for Phase B
System Input Power Factor Phs C	The system input power factor for Phase C
System Input Power Problem	The input is not qualified to provide power to the system
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral

Table 3.127 Liebert® EXS Frame 2/3—Glossary (continued)

Data Label	Data Description
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Input RMS Current Phase A	The system input RMS current for Phase A
System Input RMS Current Phase B	The system input RMS current for Phase B
System Input RMS Current Phase C	The system input RMS current for Phase C
System Output Apparent Power Phs A	System output apparent power on phase A
System Output Apparent Power Phs B	System output apparent power on phase B
System Output Apparent Power Phs C	System output apparent power on phase C
System Output Apparent Power	The sum total apparent power of all system output phases
System Output Fault	A fault has been detected in the system output
System Output Frequency	The system output frequency
System Output Nominal Frequency	The nominal (or rated) system output frequency
System Output Nominal Voltage	The nominal (or rated) system output voltage
System Output Off	The system output is off
System Output Pct Power Phase A	The system output power on phase A as a percentage of the rated capacity
System Output Pct Power Phase B	The system output power on phase B as a percentage of the rated capacity
System Output Pct Power Phase C	The system output power on phase C as a percentage of the rated capacity
System Output Power Factor Phs A	The system output power factor of phase A
System Output Power Factor Phs B	The system output power factor of phase B
System Output Power Factor Phs C	The system output power factor of phase C
System Output Power Phase A	The system output power on phase A.
System Output Power Phase B	The system output power on phase B.

Table 3.127 Liebert® EXS Frame 2/3—Glossary (continued)

Data Label	Data Description
System Output Power Phase C	The system output power on phase C.
System Output Power	The sum total power of all system output phases
System Output RMS Current Phs A	The system output RMS current for Phase A
System Output RMS Current Phs B	The system output RMS current for Phase B
System Output RMS Current Phs C	The system output RMS current for Phase C
System Output Voltage RMS A-B	The system output RMS voltage between phases A and B
System Output Voltage RMS A-N	The system output RMS voltage between phases A and Neutral
System Output Voltage RMS B-C	The system output RMS voltage between phases B and C
System Output Voltage RMS B-N	The system output RMS voltage between phases B and Neutral
System Output Voltage RMS C-A	The system output RMS voltage between phases C and A
System Output Voltage RMS C-N	The system output RMS voltage between phases C and Neutral
System Set To Operate With	If this point reports 'Redundancy' then the system is configured for redundancy and the 'Loss of Redundancy' alarm is enabled.
System Shutdown - EPO	System shutdown due to Emergency Power Off (EPO)
System Shutdown - Output Short	Shutdown was due to a short on the output.
System Status	The operating status for the system
Time Until Next Auto Battery Test	The time until the next automatic battery test is started.
Top Outlet Fan Fault	Top outlet fan fault - one or more top outlet fans have failed.
Total System Operating Time	The cumulative operation time of the unit
Transfer to Bypass - System Overload	The UPS System has transferred to bypass because the active power modules cannot support the critical load.
UPS Battery Status	UPS battery status
UPS Output on Bypass	The output power is supplied by the bypass
UPS Output Source	UPS output source
User Operation Invalid	User attempted an invalid operation.

					10 = 240 VAC 11 = 100/173 VAC 12 = 100/173rvs VAC 13 = 100/200 VAC 14 = 110/190.5 VAC 15 = 110/190.5rvs VAC 16 = 110/220 VAC 17 = 115/199 VAC 18 = 115/199rvs VAC 19 = 115/230 VAC 20 = 120/208 VAC 21 = 120/208rvs VAC 22 = 120/240 VAC 23 = 125/216.5 VAC 24 = 125/216.5rvs VAC 25 = 125/250 VAC
Silence Audible Alarm		40568	1		1 = Silence Alarm
Clear UPS faults		40569	1		1 = Clear UPS faults
Turn to bypass		40570	1		0 = Turn To Bypass
SystemConfiguration					
System Date and Time	39998	49998	2		Units : Secs since Epoch(UTC)

Table 3.130 Vertiv™ Liebert® GXE3—Glossary

Data Label	Data Description
Audible Alarm Control	Audible Alarm Control
Auto Battery Test Interval	The time between automatic battery tests.
Auto Restart Delay	If power is lost, the control will delay this amount of time after power is restored before restarting the unit.
Auto Restart	When 'enabled', the UPS will automatically restart the load when utility power is restored after a battery discharge.
Auxiliary power fault	Auxiliary power fault
Battery Charge Status	Battery charge status.
Battery Charger State	Current state of the battery charger
Battery Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value
Battery Deep Discharge	UPS depleted the batteries to the end of discharge(EOD) voltage
Battery Discharging	The battery is discharging

Table 3.130 Vertiv™ Liebert® GXE3—Glossary (continued)

Data Label	Data Description
Battery Float Voltage	The cell voltage of the battery at float recharging.
Battery last replaced time	The UPS battery last replaced time
Battery Low	The calculated battery time remaining has reached the low battery threshold
Battery Not Qualified	The UPS battery voltage is not qualified. This event will be detected even in the absence of battery disconnect or when it is open.
Battery Over Temperature	A battery temperature sensor is reporting a value above a threshold
Battery Percentage Charge	The percentage of battery charge
Battery periodic test time (hour)	Sets the hour to run the Battery periodic test.
Battery periodic test time (minute)	Sets the minute to run the Battery periodic test time.
Battery periodic test weekday	Sets the day of week to run the Battery periodic test.
Battery Rating	Total rating of all parallel strings in the battery.
Battery reminder (months)	Battery reminder (months)
Battery Self Test	Battery self test is in progress
Battery State of Health	The UPS battery State of Health
Battery Terminals Reversed	The measured battery voltage is a negative value due to reverse battery terminal connections.
Battery Test Failed	Battery test failed
Battery Test Result	The outcome of the previous battery test.
Battery Time Remaining	The calculated available time on battery
Battery to utility transition	Battery to utility transition
Battery type	Battery type of the UPS system
Bypass Abnormal In ECO Mode	UPS will return to inverter from bypass due to ECO Mode bypass abnormal condition.
Bypass Backfeed Detected	The system detected a voltage on the bypass when none was expected
Bypass disabled	Bypass disabled
Bypass Input Frequency	The bypass input frequency
Bypass Input Voltage RMS L1-N	The bypass input RMS voltage between Line 1 and Neutral
Bypass Nominal Voltage	Bypass nominal (or rated) voltage
Bypass Not Available	A problem associated with the bypass has been detected
Bypass voltage lower limit	Sets the percentage that the input voltage may be below the selected output voltage setting and remain in Bypass mode.
Bypass voltage upper limit	Sets the percentage that the input voltage may be above the selected output voltage setting and remain in Bypass mode.
Charger Failure	Charger Failure - Charger is off
Clear UPS faults	Clear UPS faults

Table 3.130 Vertiv™ Liebert® GXE3—Glossary (continued)

Data Label	Data Description
DC Bus Abnormal	The system has detected an abnormal DC Bus Voltage.
DC Bus Nominal Voltage	The nominal (or rated) voltage between the positive and negative terminals of the DC bus at the battery input
DC Bus Voltage	The voltage between the positive and negative terminals of the DC bus at the battery input
DC to DC Converter Fault	A failure has occurred in the battery discharge circuit.
Device Faults were cleared as requested	Device Faults were cleared as requested
Discharge protect time	Sets the maximum discharge time when on battery.
ECO frequency range	Sets the amount that the input frequency may be above or below the selected frequency setting and remain in ECO mode.
ECO Mode Operation State	This setting is used to enable or disable ECO Mode.
ECO Mode Status	Current ECO Mode Status
ECO requalification time	Length of time that the UPS requires the input voltage and frequency tolerances to be maintained before switching to ECO-mode.
ECO voltage range	Sets the percentage that the input voltage may be above or below the selected output voltage setting and remain in ECO mode.
Emergency Power Off - Latched	System output is off - 'Emergency Power Off (EPO) - latched' requires manual reset
Equal charge	Equal charge
Equipment Over Temperature	Equipment over temperature summary event
External Battery Cabinets Ah	Sets the amp-hour rating of the external battery when using non-Vertiv external batteries. Calculated automatically for Vertiv EBCs.
General Fault	A general fault in the UPS has been detected.
Guaranteed shutdown	Forces a continued shutdown of the UPS once the Low Battery threshold is reached, even if input power is restored during this time.
Inlet Air Temperature	The temperature of the inlet air
Input Energy	Input energy consumption since the last reset of this value.
Input Wiring Fault	The neutral/ground conductors on the input wiring are not properly bonded, or the line/neutral conductors have been swapped.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Inverter Failure	Inverter failure - inverter output is off
Inverter On/Off State	inverter on/off state
Inverter Relay Fault	The inverter relay has malfunctioned.
IT system compatibility	Allows for compatibility with IT grounding system. When this option is enabled, the Input Phase Reversed and Input Ground Lost alarms are disabled.
Low Battery Warning Time	When battery time remaining falls to, or below, this value the low battery alarm is activated.
Mains Input Neutral Lost	Loss of neutral in the input source is detected.
Manual Battery Test	Command to initiate a manual battery test.

Table 3.130 Vertiv™ Liebert® GXE3—Glossary (continued)

Data Label	Data Description
Manual Power On	Manual Power On
Max Charge Current	The maximum allowed current to be used for charging the batteries.
Nominal Battery Capacity	The nominal (or rated) battery capacity time at full load
Nominal Power Factor	The nominal (or rated) system power factor.
Number of EBC Installed	The total number of Extended Battery Cabinets installed.
Output Apparent Power Rating	Output apparent power rating
Output Energy	Total accumulated energy output, since last energy reset.
Output off due to abnormal bypass	Output off due to abnormal bypass
Output off voltage is not zero	Output off voltage is not zero
Output On Delay	When a value is written to this point the output will be turned on after the specified time has elapsed.
Output Overload	An overload exists on the output.
Output Voltage Setting	Sets the nominal system voltage.
Power Module Shutdown - Over Temperature	Power Module has shutdown due to over temperature.
Reboot With Delay	When a value is written to this point the output will be turned off immediately and then turned back on after the specified time has elapsed.
Rectifier Failure	Rectifier failure - rectifier is off
Remote Power On	Remote Power On
Replace Battery	The battery is due for replacement.
Server Class	The general classification for this system
Set External Battery Cabinet Quantity	Autodetect or manually enter number of External Battery Cabinets.
Shutdown After Delay	When a value is written to this point the system will shutdown after the specified time has elapsed and output will remain off.
Shutdown Pending	Shutdown is pending.
Shutdown Reason	The reason for the most recent shutdown
Silence Audible Alarm	Silence Audible Alarm
Startup on bypass	Allows the UPS to start-up in bypass mode before transitioning to the inverter.
System Date and Time	The system date and time
System Fan Failure	System fan failure - one or more fans have failed
System Input Black Out Count	The number of occurrences, since the last reset, where the input was not qualified to provide power to the system
System Input Brown Out Count	The number of occurrences, since the last reset, where the system input voltage has fallen below a pre-determined threshold for a specified amount of time
System Input Current Limit	The RMS input current has reached the input current limit threshold

Table 3.130 Vertiv™ Liebert® GXE3—Glossary (continued)

Data Label	Data Description
System Input Frequency	The system input frequency
System Input Max Voltage L1-N	The maximum system input voltage measurement for Line 1-N since the last reset
System Input Min Voltage L1-N	The minimum system input voltage measurement for Line 1-N since the last reset
System Input Nominal Current	The nominal (or rated) system input current
System Input Nominal Frequency	The nominal (or rated) system input frequency
System Input Nominal Voltage	The nominal (or rated) system input voltage
System Input Phase Count	The number of phases for the system input
System Input Power Factor L1	The system input power factor for Line 1
System Input Power Problem	The input is not qualified to provide power to the system
System Input RMS Current L1	The system input RMS current for Line 1
System Input RMS L1-N	The System Input RMS Voltage between Line 1 and Neutral
System Output Apparent Power L1	System output apparent power on Line 1
System Output Apparent Power	The sum total apparent power of all system output phases
System Output Frequency	The system output frequency
System Output Nominal Frequency	The nominal (or rated) system output frequency
System Output Nominal Voltage	The nominal (or rated) system output voltage
System Output Off	The system output is off
System Output Pct Power L1	The system output power on Line 1 as a percentage of the rated capacity
System Output Pct Power	The system output power as a percentage of the rated capacity.
System Output Power Factor L1	The system output power factor of Line 1
System Output Power L1	The system output power on Line 1.
System Output Power	The sum total power of all system output phases
System Output RMS Current L1	The system output RMS current for Line 1
System Output Voltage RMS L1-N	The system output RMS voltage between Line 1 and Neutral
System Shutdown - Output Short	Shutdown was due to a short on the output.
System Shutdown - Remote Shutdown	Shutdown was due to a remote communications shutdown command.
System Status	The operating status for the system
Temperature compensation	When enabled, the UPS will adjust the battery charging voltage based on temperature to preserve battery life.
Total Number of Battery Discharges	The total number of battery discharges.
Turn on failed	Turn on failed

Table 3.130 Vertiv™ Liebert® GXE3—Glossary (continued)

Data Label	Data Description
Turn to bypass	Turn to bypass
UPS Battery Status	UPS battery status
UPS Output on Bypass	The output power is supplied by the bypass
UPS Output on Inverter	The output power is supplied by the inverter
UPS Output Source	UPS output source
UPS Topology	UPS Topology
UPS was reset to factory defaults	UPS was reset to factory defaults

Inverter On/Off State	30543		1		0 = off 1 = on
Inlet Air Temperature	30544		1		Units : deg C Int16

Table 3.134 Liebert® GXT3 and Liebert® GXT4—Input and Holding (continued)

Data Label	Input	Holding	# of Reg	Scale	Notes/Units
Inlet Air Temperature	30545		1		Units : deg F Int16
Shutdown Reason	30546		1		0 = None 1 = Over Temperature 2 = Overload 3 = DC Bus Overload 4 = Output Short 5 = Line Swap 6 = Low Battery 7 = Remote Command 8 = Input Under Voltage 9 = Power Factor Correction Fail 10 = External Signal Command
DC Converter Status	30547		1		0 = off 1 = on
UPS Topology	30548		1		0 = unknown 1 = Offline 2 = Line Interactive 3 = Online
Bypass/Inverter Input Config	30549		1		1 = Single/Combined Source 2 = Dual/Separate Sources
Audible Alarm Control	30550	40550	1		0 = off 1 = on
Abort Command		40551	1		1 = Issue Command
Reset Power Statistics		40552	1		1 = Reset
Silence Audible Alarm		40553	1		1 = Silence Alarm

If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.

Table 3.135 Liebert® GXT3 and Liebert® GXT4—Glossary

Data Label	Data Description
Abort Command	Attempt to abort a previously issued command to the device that is still pending
Audible Alarm Control	Audible Alarm Control
Auto Restart Delay	If power is lost, the control will delay this amount of time after power is restored before restarting the unit.
Auto Restart	When 'enabled', the UPS will automatically restart the load when utility power is restored after a battery discharge.
Automatic Battery Test	Enable/disable the automatic battery test schedule.

Table 3.135 Liebert® GXT3 and Liebert® GXT4—Glossary (continued)

Data Label	Data Description
Battery Cabinet Type	Type of extended battery cabinets.
Battery Charge Compensating	Battery charge algorithm changed due to battery temperature
Battery Charge Status	Battery charge status.
Battery Charger State	Current state of the battery charger
Battery Discharge Time	The time on battery operation for this discharge
Battery Discharging	The battery is discharging
Battery Float Voltage	The cell voltage of the battery at float recharging.
Battery Low	The calculated battery time remaining has reached the low battery threshold
Battery Over Voltage	The system has detected that the battery voltage has exceeded a predetermined limit.
Battery Percentage Charge	The percentage of battery charge
Battery Rating	Total rating of all parallel strings in the battery.
Battery Self Test	Battery self test is in progress
Battery Test Failed	Battery test failed
Battery Test Result	The outcome of the previous battery test.
Battery Time Remaining	The calculated available time on battery
Battery Under Voltage	Battery voltage is too low.
Bypass Input Frequency	The bypass input frequency
Bypass Input RMS Current Line 2	The bypass input RMS current for Line 2
Bypass Input RMS Current	The bypass input RMS current.
Bypass Input Voltage RMS L1-L2	The bypass input RMS voltage between Lines 1 and 2
Bypass Input Voltage RMS L1-N	The bypass input RMS voltage between Line 1 and Neutral
Bypass Input Voltage RMS L2-N	The bypass input RMS voltage between Line 2 and Neutral
Bypass Nominal Voltage	Bypass nominal (or rated) voltage
Bypass Not Available	A problem associated with the bypass has been detected
Bypass/Inverter Input Config	Input source configuration for the bypass and inverter.
Charger Failure	Charger Failure - Charger is off
DC Bus Nominal Voltage	The nominal (or rated) voltage between the positive and negative terminals of the DC bus at the battery input
DC Bus Voltage	The voltage between the positive and negative terminals of the DC bus at the battery input
DC Converter Status	The operating state of the dc converter.

Table 3.135 Liebert® GXT3 and Liebert® GXT4—Glossary (continued)

Data Label	Data Description
DC to DC Converter Fault	A failure has occurred in the battery discharge circuit.
ECO Mode Operation State	This setting is used to enable or disable ECO Mode.
ECO Mode Status	Current ECO Mode Status
Emergency Power Off - Latched	System output is off - 'Emergency Power Off (EPO) - latched' requires manual reset
Equipment Over Temperature	Equipment over temperature summary event
Inlet Air Temperature	The temperature of the inlet air
Input Frequency Deviation	The input frequency is outside of the normal range.
Input Overvoltage	One or more of the input phase voltages has exceeded the limit.
Input Undervoltage	One or more of the input phase voltages has dropped below the limit.
Input Wiring Fault	The neutral/ground conductors on the input wiring are not properly bonded, or the line/neutral conductors have been swapped.
Inverter Failure	Inverter failure - inverter output is off
Inverter On/Off State	inverter on/off state
Loss of Redundancy	The multi-module collection doesn't have enough modules to satisfy the redundancy configuration.
Low Battery Warning Time	When battery time remaining falls to, or below, this value the low battery alarm is activated.
Maintenance Bypass Breaker Closed	The maintenance bypass breaker is closed.
Manual Battery Test	Command to initiate a manual battery test.
Nominal Battery Capacity	The nominal (or rated) battery capacity time at full load
Nominal Power Factor	The nominal (or rated) system power factor.
Number of EBC Installed	The total number of Extended Battery Cabinets installed.
Outlet Group Identifier	A runtime assigned outlet group identification number
Outlet Group Power Control	Outlet Group Power Control (OFF, ON, Cycle, etc)
Output Apparent Power Rating	Output apparent power rating
Output On Delay	When a value is written to this point the output will be turned on after the specified time has elapsed.
Output Overload	An overload exists on the output.
Output Overvoltage	One or more of the output phase voltages has exceeded the limit.
Output Undervoltage	One or more of the output phase voltages has dropped below the limit.
Parallel Comm Warning	Parallel communication bus warning
Power Factor Correction	The state of the power factor correction circuitry of the system
Reboot With Delay	When a value is written to this point the output will be turned off immediately and then turned back on after the specified time has elapsed.

Table 3.135 Liebert® GXT3 and Liebert® GXT4—Glossary (continued)

Data Label	Data Description
Rectifier Failure	Rectifier failure - rectifier is off
Replace Battery	The battery is due for replacement.
Reset Power Statistics	Reset Power Statistics
Server Class	The general classification for this system
Shutdown After Delay	When a value is written to this point the system will shutdown after the specified time has elapsed and output will remain off.
Shutdown Pending	Shutdown is pending.
Shutdown Reason	The reason for the most recent shutdown
Silence Audible Alarm	Silence Audible Alarm
System Fan Failure	System fan failure - one or more fans have failed
System Input Black Out Count	The number of occurrences, since the last reset, where the input was not qualified to provide power to the system
System Input Brown Out Count	The number of occurrences, since the last reset, where the system input voltage has fallen below a pre-determined threshold for a specified amount of time
System Input Frequency	The system input frequency
System Input Max Voltage L1-N	The maximum system input voltage measurement for Line 1-N since the last reset
System Input Max Voltage L2-N	The maximum system input voltage measurement for Line 2-N since the last reset
System Input Min Voltage L1-N	The minimum system input voltage measurement for Line 1-N since the last reset
System Input Min Voltage L2-N	The minimum system input voltage measurement for Line 2-N since the last reset
System Input Nominal Current	The nominal (or rated) system input current
System Input Nominal Frequency	The nominal (or rated) system input frequency
System Input Nominal Voltage	The nominal (or rated) system input voltage
System Input Power Problem	The input is not qualified to provide power to the system
System Input RMS Current L1	The system input RMS current for Line 1
System Input RMS Current L2	The system input RMS current for Line 2
System Input RMS L1-L2	The System Input RMS Voltage between Line 1 and Line 2
System Input RMS L1-N	The System Input RMS Voltage between Line 1 and Neutral
System Input RMS L2-N	The System Input RMS Voltage between Line 2 and Neutral

Table 3.135 Liebert® GXT3 and Liebert® GXT4—Glossary (continued)

Data Label	Data Description
System Output Apparent Power L1	System output apparent power on Line 1
System Output Apparent Power L2	System output apparent power on Line 2
System Output Apparent Power	The sum total apparent power of all system output phases
System Output Frequency	The system output frequency
System Output Max Voltage L1-N	The maximum system output voltage measurement for Line 1-N since the last reset.
System Output Max Voltage L2-N	The maximum system output voltage measurement for Line 2-N since the last reset.
System Output Min Voltage L1-N	The minimum system output voltage measurement for Line 1-N since the last reset.
System Output Min Voltage L2-N	The minimum system output voltage measurement for Line 2-N since the last reset.
System Output Nominal Frequency	The nominal (or rated) system output frequency
System Output Nominal Voltage	The nominal (or rated) system output voltage
System Output Off	The system output is off
System Output Pct Power L1	The system output power on Line 1 as a percentage of the rated capacity
System Output Pct Power L2	The system output power on Line 2 as a percentage of the rated capacity
System Output Pct Power	The system output power as a percentage of the rated capacity.
System Output Power L1	The system output power on Line 1.
System Output Power L2	The system output power on Line 2.
System Output Power	The sum total power of all system output phases
System Output RMS Current L1	The system output RMS current for Line 1
System Output RMS Current L2	The system output RMS current for Line 2
System Output Voltage RMS L1-L2	The system output RMS voltage between Lines 1 and 2
System Output Voltage RMS L1-N	The system output RMS voltage between Line 1 and Neutral
System Output Voltage RMS L2-N	The system output RMS voltage between Line 2 and Neutral
System Status	The operating status for the system
Unspecified General Event	One or more unspecified events active. See local unit display for further details.

Table 3.135 Liebert® GXT3 and Liebert® GXT4—Glossary (continued)

Data Label	Data Description
UPS Battery Status	UPS battery status
UPS Output on Bypass	The output power is supplied by the bypass
UPS Output Source	UPS output source
UPS Topology	UPS Topology

Table 3.138 Liebert® GXT5—Glossary

Data Label	Data Description
Acknowledge External Battery Cabinet Removed	Acknowledge the detected removal of an external battery cabinet.
Any mode shutdown auto restart	Automatically restart the UPS after an Any Mode Shutdown signal is received and then cleared.
Audible Alarm Control	Audible Alarm Control
Auto Battery Test Interval	The time between automatic battery tests.
Auto Restart Delay	If power is lost, the control will delay this amount of time after power is restored before restarting the unit.
Auto Restart	When 'enabled', the UPS will automatically restart the load when utility power is restored after a battery discharge.
Automatic Battery Test	Enable/disable the automatic battery test schedule.
Auxiliary power fault	Auxiliary power fault
Average system efficiency	Average system efficiency
Battery average temperature	Battery average temperature
Battery Cabinet Address Fault	Battery Cabinet Addresses are set incorrectly.
Battery Cabinet Communication Fail	Battery Cabinet Cable failure.
Battery Cabinet Connect Fault	Battery cabinet ports have reversed connections.
Battery cabinet connection abnormal	Battery cabinet connection abnormal
Battery Cabinet Parallel Failure	Battery Cabinet Parallel failure of the online lithium battery cabinet.
Battery Cabinet Serial Number Illegal Error	Serial Number of the battery cabinet is illegal.
Battery Cabinet SOH Low	Battery cabinet state of health is low.
Battery Cabinet Type	Type of extended battery cabinets.
Battery Charge Status	Battery charge status.
Battery Charger State	Current state of the battery charger
Battery Current Abnormal	Battery current out-of-range of the online lithium battery cabinet.

Table 3.138 Liebert® GXT5—Glossary (continued)

Data Label	Data Description
Battery Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value
Battery Deep Discharge	UPS depleted the batteries to the end of discharge(EOD) voltage
Battery Discharge Time	The time on battery operation for this discharge
Battery Discharging	The battery is discharging
Battery expiration date	Predicted data of expiration of the battery.
Battery Float Voltage	The cell voltage of the battery at float recharging.
Battery last replaced time	The UPS battery last replaced time
Battery Low	The calculated battery time remaining has reached the low battery threshold
Battery lowest temperature	Battery lowest temperature
Battery Not Qualified	The UPS battery voltage is not qualified. This event will be detected even in the absence of battery disconnect or when it is open.
Battery Over Temperature	A battery temperature sensor is reporting a value above a threshold
Battery Percentage Charge	The percentage of battery charge
Battery periodic test time (hour)	Sets the hour to run the Battery periodic test.
Battery periodic test time (minute)	Sets the minute to run the Battery periodic test time.
Battery periodic test weekday	Sets the day of week to run the Battery periodic test.
Battery Rating	Total rating of all parallel strings in the battery.
Battery reminder (months)	Battery reminder (months)
Battery Self Test	Battery self test is in progress
Battery State of Health	Battery State of Health
Battery State of Health	The UPS battery State of Health
Battery Temperature Abnormal	Battery Temperature out-of-range of the online Lithium Battery Cabinet.
Battery Temperature	The temperature of the batteries
Battery Terminals Reversed	The measured battery voltage is a negative value due to reverse battery terminal connections.
Battery Test Failed	Battery test failed
Battery Test Result	The outcome of the previous battery test.
Battery Time Remaining	The calculated available time on battery
Battery to utility transition	Battery to utility transition
Battery Total Discharge Time	The cumulative battery discharge time
Battery type	Battery type of the UPS system
Battery Voltage Abnormal	Battery voltage out-of-range in the online lithium battery cabinet.
Bypass Backfeed Detected	The system detected a voltage on the bypass when none was expected

Table 3.138 Liebert® GXT5—Glossary (continued)

Data Label	Data Description
Bypass disabled	Bypass disabled
Bypass Input Frequency	The bypass input frequency
Bypass Input Voltage RMS L1-L2	The bypass input RMS voltage between Lines 1 and 2
Bypass Input Voltage RMS L1-N	The bypass input RMS voltage between Line 1 and Neutral
Bypass Input Voltage RMS L2-N	The bypass input RMS voltage between Line 2 and Neutral
Bypass Nominal Voltage	Bypass nominal (or rated) voltage
Bypass Not Available	A problem associated with the bypass has been detected
Bypass voltage lower limit	Sets the percentage that the input voltage may be below the selected output voltage setting and remain in Bypass mode.
Bypass voltage upper limit	Sets the percentage that the input voltage may be above the selected output voltage setting and remain in Bypass mode.
Charger Failure	Charger Failure - Charger is off
Clear UPS faults	Clear UPS faults
DC Bus Abnormal	The system has detected an abnormal DC Bus Voltage.
DC Bus Nominal Voltage	The nominal (or rated) voltage between the positive and negative terminals of the DC bus at the battery input
DC Bus Voltage	The voltage between the positive and negative terminals of the DC bus at the battery input
DC to DC Converter Fault	A failure has occurred in the battery discharge circuit.
Device Faults were cleared, as requested	Device Faults were cleared, as requested
Discharge protect time	Sets the maximum discharge time when on battery.
Dry contact 1 input	Selects the action taken by the UPS when the input of dry-contact 1 is triggered
Dry contact 2 input	Selects the action taken by the UPS when the input of dry-contact 2 is triggered
Dry contact 5 output	Selects the output of dry-contact 5
Dry contact 6 output	Selects the output of dry-contact 6
ECO frequency range	Sets the amount that the input frequency may be above or below the selected frequency setting and remain in ECO mode.
ECO Mode Operation State	This setting is used to enable or disable ECO Mode.
ECO Mode Status	Current ECO Mode Status
ECO requalification time	Length of time that the UPS requires the input voltage and frequency tolerances to be maintained before switching to ECO-mode.
ECO voltage range	Sets the percentage that the input voltage may be above or below the selected output voltage setting and remain in ECO mode.
Emergency Power Off - Latched	System output is off - 'Emergency Power Off (EPO) - latched' requires manual reset
Equal charge	Equal charge
Equipment Over Temperature	Equipment over temperature summary event

Table 3.138 Liebert® GXT5—Glossary (continued)

Data Label	Data Description
External Battery Cabinet Removed	One or more external battery cabinets have been removed.
External Battery Cabinets Ah	Sets the amp-hour rating of the external battery when using non-Vertiv external batteries. Calculated automatically for Vertiv EBCs.
Frequency selection	Selects the frequency of the output.
General Fault	A general fault in the UPS has been detected.
Guaranteed shutdown	Forces a continued shutdown of the UPS once the Low Battery threshold is reached, even if input power is restored during this time.
Inlet Air Temperature	The temperature of the inlet air
Input Dry contact action setting	Selects the action taken by the UPS when the input of dry-contact is triggered when UPS work with Transformer distribution unit.
Input dry contact	Selects the states of the dry contact inputs
Input Energy	Input energy consumption since the last reset of this value.
Input Source Backfeed	The battery is backfeeding the input source.
Input Wiring Fault	The neutral/ground conductors on the input wiring are not properly bonded, or the line/neutral conductors have been swapped.
Insufficient capacity to start	Insufficient capacity to start
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Inverter Failure	Inverter failure - inverter output is off
Inverter On/Off State	inverter on/off state
Inverter Relay Fault	The inverter relay has malfunctioned.
IT system compatibility	Allows for compatibility with IT grounding system. When this option is enabled, the Input Phase Reversed and Input Ground Lost alarms are disabled.
Lithium Battery Cabinet Address Set Error	Lithium battery cabinet addresses have been set incorrectly.
Lithium Battery Cabinet Check	Check if the battery is present
Lithium Battery Cabinet Communication Failure	Battery cabinet communication has been disrupted.
Lithium Battery Cabinet mismatch the unit.	The warning is triggered when the online lithium battery cabinet can't be used by the UPS.
Lithium Battery Cabinet Online Number Error	The online battery cabinet number is different from the configured number.
Lithium Battery Cabinet State of Charge	State of charge of the online lithium battery cabinet.
Lithium Battery Cabinet Wait Charge	The battery is waiting for charge.
Lithium Battery Manual Wake-up	Wake up the lithium battery manually
Lithium Battery Status.	State of the selected Lithium Battery Cabinet.

Table 3.138 Liebert® GXT5—Glossary (continued)

Data Label	Data Description
Lithium-Ion Battery System Abnormal	Lithium-Ion Battery System Abnormal
Load Sharing Fault	Difference between any phase inverter current of unit and the relevant average output current of parallel system is more than a specific percent of nominal current.
Local output is disconnected	Local output is disconnected
Loss of Redundancy	The multi-module collection doesn't have enough modules to satisfy the redundancy configuration.
Low Battery Warning Time	When battery time remaining falls to, or below, this value the low battery alarm is activated.
Mains Input Neutral Lost	Loss of neutral in the input source is detected.
Maintenance Bypass Breaker Closed	The maintenance bypass breaker is closed.
Manual Battery Test	Command to initiate a manual battery test.
Manual lithium battery wake up occurred.	Manual Lithium Battery Wake Up Occurred
Manual Power On	Manual Power On
Master or slave	State of unit in a Parallel System, Master or slave.
Max Charge Current	The maximum allowed current to be used for charging the batteries.
Maximum Cell Voltage	The maximum cell voltage of the paralleled lithium battery cabinets.
Minimum Cell Voltage	The minimum cell voltage of the paralleled lithium battery cabinets.
Model supports Transformer Distribution Unit	Model supports Transformer Distribution Unit
Nominal Battery Capacity	The nominal (or rated) battery capacity time at full load
Nominal Power Factor	The nominal (or rated) system power factor.
Number of EBC Installed	The total number of Extended Battery Cabinets installed.
Number of Lithium Battery Cabinets Over Limit	The number of batteries connected to the system exceeds the maximum
Number of parallel units	The number of modules in a parallel system
Outlet Group Identifier	A runtime assigned outlet group identification number
Outlet Group Power Control	Outlet Group Power Control (OFF, ON, Cycle, etc)
Output Apparent Power Rating	Output apparent power rating
Output dry contact	Selects the states of the dry contact outputs
Output Energy	Total accumulated energy output, since last energy reset.
Output off due to abnormal bypass	Output off due to abnormal bypass
Output off voltage is not zero	Output off voltage is not zero
Output On Delay	When a value is written to this point the output will be turned on after the specified time has elapsed.
Output Overload	An overload exists on the output.

Table 3.138 Liebert® GXT5—Glossary (continued)

Data Label	Data Description
Output Voltage Setting	Sets the nominal system voltage.
Parallel Cable Failure	The UPS parallel system communications is abnormal. A problem with the parallel cable may exist.
Parallel Comm Warning	Parallel communication bus warning
Parallel ID	Parallel Unit ID
Parallel Output Apparent Power	The sum total apparent power of a parallel system
Parallel output frequency abnormal	Parallel output frequency abnormal
Parallel Output Power	The sum total output power of a parallel system
Power Module Shutdown - Over Temperature	Power Module has shutdown due to over temperature.
Reboot With Delay	When a value is written to this point the output will be turned off immediately and then turned back on after the specified time has elapsed.
Rectifier Failure	Rectifier failure - rectifier is off
Rectifier soft start failure	Rectifier soft start failure
Remote Power On	Remote Power On
Replace Battery	The battery is due for replacement.
Reset Power Statistics	Reset Power Statistics
Scheduled power off occurred	Scheduled power off occurred
Scheduled power on occurred	Scheduled power on occurred
Server Class	The general classification for this system
Set External Battery Cabinet Quantity	Autodetect or manually enter number of External Battery Cabinets.
Shutdown After Delay	When a value is written to this point the system will shutdown after the specified time has elapsed and output will remain off.
Shutdown Pending	Shutdown is pending.
Shutdown Reason	The reason for the most recent shutdown
Silence Audible Alarm	Silence Audible Alarm
Sleep mode power off day of week	Sets the day of week to turn off the UPS.
Sleep mode power off time Hour	Sets the hour to power off the UPS on the selected day
Sleep mode power off time Minute	Sets the minute to power off the UPS on the selected day
Sleep mode power on day of week	Sets the day of week to turn on the UPS.
Sleep mode power on time Hour	Sets the hour to power on the UPS on the selected day
Sleep mode power on time Minute	Sets the minute to power on the UPS on the selected day
Sleep mode	Allows the UPS to turn off the output on a weekly schedule
Start with no battery	Allows the system to turn on the output with no battery connected.

Table 3.138 Liebert® GXT5—Glossary (continued)

Data Label	Data Description
Startup on bypass	Allows the UPS to start-up in bypass mode before transitioning to the inverter.
System Date and Time	The system date and time
System Fan Failure	System fan failure - one or more fans have failed
System Input Black Out Count	The number of occurrences, since the last reset, where the input was not qualified to provide power to the system
System Input Brown Out Count	The number of occurrences, since the last reset, where the system input voltage has fallen below a pre-determined threshold for a specified amount of time
System Input Current Imbalance	System Input Currents are Imbalanced
System Input Current Limit	The RMS input current has reached the input current limit threshold
System Input Frequency	The system input frequency
System Input Max Voltage L1-N	The maximum system input voltage measurement for Line 1-N since the last reset
System Input Max Voltage L2-N	The maximum system input voltage measurement for Line 2-N since the last reset
System Input Max Voltage L3-N	The maximum system input voltage measurement for Line 3-N since the last reset
System Input Min Voltage L1-N	The minimum system input voltage measurement for Line 1-N since the last reset
System Input Min Voltage L2-N	The minimum system input voltage measurement for Line 2-N since the last reset
System Input Min Voltage L3-N	The minimum system input voltage measurement for Line 3-N since the last reset
System Input Nominal Current	The nominal (or rated) system input current
System Input Nominal Frequency	The nominal (or rated) system input frequency
System Input Nominal Voltage	The nominal (or rated) system input voltage
System Input Phase Count	The number of phases for the system input
System Input Power Factor L1	The system input power factor for Line 1
System Input Power Factor L2	The system input power factor for Line 2
System Input Power Factor L3	The system input power factor for Line 3
System Input Power Problem	The input is not qualified to provide power to the system
System Input RMS Current L1	The system input RMS current for Line 1
System Input RMS Current L2	The system input RMS current for Line 2
System Input RMS Current L3	The system input RMS current for Line 3
System Input RMS L1-L2	The System Input RMS Voltage between Line 1 and Line 2
System Input RMS L1-N	The System Input RMS Voltage between Line 1 and Neutral
System Input RMS L2-L3	The System Input RMS Voltage between Line 2 and Line 3
System Input RMS L2-N	The System Input RMS Voltage between Line 2 and Neutral
System Input RMS L3-L1	The System Input RMS Voltage between Line 3 and Line 1
System Input RMS L3-N	The System Input RMS Voltage between Line 3 and Neutral
System Output Apparent Power L1	System output apparent power on Line 1

Table 3.138 Liebert® GXT5—Glossary (continued)

Data Label	Data Description
System Output Apparent Power L2	System output apparent power on Line 2
System Output Apparent Power	The sum total apparent power of all system output phases
System Output Fault	A fault has been detected in the system output
System Output Frequency	The system output frequency
System output Inhibit - Ext	System output is inhibited by an external signal
System Output Nominal Frequency	The nominal (or rated) system output frequency
System Output Nominal Voltage	The nominal (or rated) system output voltage
System Output Off	The system output is off
System Output Pct Power L1	The system output power on Line 1 as a percentage of the rated capacity
System Output Pct Power L2	The system output power on Line 2 as a percentage of the rated capacity
System Output Pct Power	The system output power as a percentage of the rated capacity.
System Output Power Factor L1	The system output power factor of Line 1
System Output Power Factor L2	The system output power factor of Line 2
System Output Power L1	The system output power on Line 1.
System Output Power L2	The system output power on Line 2.
System Output Power	The sum total power of all system output phases
System Output RMS Current L1	The system output RMS current for Line 1
System Output RMS Current L2	The system output RMS current for Line 2
System Output Voltage RMS L1-L2	The system output RMS voltage between Lines 1 and 2
System Output Voltage RMS L1-N	The system output RMS voltage between Line 1 and Neutral
System Output Voltage RMS L2-N	The system output RMS voltage between Line 2 and Neutral
System Shutdown - Output Short	Shutdown was due to a short on the output.
System Shutdown - Remote Shutdown	Shutdown was due to a remote communications shutdown command.
System Shutdown - Transformer Over Temperature	System shutdown due to transformer over temperature.
System Status	The operating status for the system
Temperature compensation	When enabled, the UPS will adjust the battery charging voltage based on temperature to preserve battery life.
The Highest Battery Temperature	The highest battery temperature among all installed Battery Modules.
Total Number of Battery Discharges	The total number of battery discharges.
Transformer Overtemperature	Transformer temperature has exceeded the limit
Turn on failed	Turn on failed
Turn to bypass	Turn to bypass

Table 3.138 Liebert® GXT5—Glossary (continued)

Data Label	Data Description
Unspecified General Event	One or more unspecified events active. See local unit display for further details.
UPS Battery Status	UPS battery status
UPS Output on Bypass	The output power is supplied by the bypass
UPS Output on Inverter	The output power is supplied by the inverter
UPS Output Source	UPS output source
UPS Topology	UPS Topology
UPS was reset to factory defaults	UPS was reset to factory defaults

Table 3.139 Liebert® HiNet—Status and Coil

Data Description	Status	Coil	Number of Bits	Scale	Notes / Units
DC-To-DC Converter On	10042	—	1	—	—
Load On Inverter	10073	—	1	—	—
Bypass Active	10074	—	1	—	—
Load On Battery	10128	—	1	—	—
Permanently On Bypass	10133	—	1	—	—
Bypass SCR Open Circuit	10149	—	1	—	—
Low Battery - Shutdown Imminent	10152	—	1	—	—
Output Overload	10154	—	1	—	—
Inverter Unsynchronized	10160	—	1	—	—
Input Power Supply Fail	10186	—	1	—	—
Bypass Input Voltage/Frequency Fault	10202	—	1	—	—

If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.

Table 3.140 Liebert® HiNet—Input and Holding

Data Description	Input Register	Holding Register	# of Reg.	Scale	Notes / Units
Number of Input Lines	30004	40004	1	—	Bits 12 - 15
Number of Bypass Lines	30004	40004	1	—	Bits 4 - 7
Number of Output Lines	30004	40004	1	—	Bits 8 - 11
Number of SubModules	30009	40009	1	—	-
Number of Battery Cells	30012	40012	1	—	-
Load (Apparent Power)	30102	—	2	—	VA
Load (Real Power)	30104	—	2	—	W

Table 3.140 Liebert® HiNet—Input and Holding (continued)

Data Description	Input Register	Holding Register	# of Reg.	Scale	Notes / Units
Input Frequency	30107	—	1	10	Hz
Output Frequency	30108	—	1	10	Hz
Battery Voltage	30113	—	1	—	V
Battery Current (Charge/Discharge)	30114	—	1	—	A
Battery Charge Percentage	30116	—	1	—	%
Ambient Temperature	30119	—	1	—	deg C
Input Voltage L1	30153	—	1	—	V
Input Current L1	30154	—	1	—	A
Output Voltage L1	30163	—	1	—	V
Output Current L1	30164	—	1	—	A
Input Voltage L2	30203	—	1	—	V
Input Current L2	30204	—	1	—	A
Input Voltage L3	30253	—	1	—	V
Input Current L3	30254	—	1	—	A

If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.

Table 3.145 Liebert® EXS and Liebert® ITA2—Glossary

Data Label	Data Description
Glossary	
Ambient temperature high pre-alarm	The ambient temperature is close to the upper limit of the operating temperature.
Ambient temperature higher than recommended	The ambient temperature is higher than the upper limit of the recommended temperature.
Ambient temperature low pre-alarm	The ambient temperature is close to the lower limit of the operating temperature.
Ambient temperature lower than recommended	The ambient temperature is lower than the lower limit of the recommended temperature.
Audible Alarm Control	Audible Alarm Control
Auto Battery Test Interval	The time between automatic battery tests.
Auto Restart Delay	If power is lost, the control will delay this amount of time after power is restored before restarting the unit.
Auto Restart	When 'enabled', the UPS will automatically restart the load when utility power is restored after a battery discharge.
Automatic Battery Test	Enable/disable the automatic battery test schedule.
Battery Cabinet Address Fault	Battery Cabinet Addresses are set incorrectly.
Battery Cabinet Communication Fail	Battery Cabinet Cable failure.
Battery Cabinet Connect Fault	Battery cabinet ports have reversed connections.
Battery Cabinet Parallel Failure	Battery Cabinet Parallel failure of the online lithium battery cabinet.
Battery Cabinet Serial Number Illegal Error	Serial Number of the battery cabinet is illegal.
Battery Cabinet SOH Low	Battery cabinet state of health is low.
Battery Cabinet Type	Type of extended battery cabinets.
Battery Charge Status	Battery charge status.
Battery Current Abnormal	Battery current out-of-range of the online lithium battery cabinet.
Battery Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value
Battery Deep Discharge	UPS depleted the batteries to the end of discharge(EOD) voltage

Table 3.145 Liebert® EXS and Liebert® ITA2—Glossary (continued)

Data Label	Data Description
Battery Discharge Time	The time on battery operation for this discharge
Battery Discharging	The battery is discharging
Battery Low	The calculated battery time remaining has reached the low battery threshold
Battery Not Qualified	The UPS battery voltage is not qualified. This event will be detected even in the absence of battery disconnect or when it is open.
Battery Percentage Charge	The percentage of battery charge
Battery Rating	Total rating of all parallel strings in the battery.
Battery Self Test	Battery self test is in progress
Battery State of Health	Battery State of Health
Battery Temperature Abnormal	Battery Temperature out-of-range of the online Lithium Battery Cabinet.
Battery Temperature	The temperature of the batteries
Battery Terminals Reversed	The measured battery voltage is a negative value due to reverse battery terminal connections.
Battery Test Failed	Battery test failed
Battery Test Result	The outcome of the previous battery test.
Battery Time Remaining	The calculated available time on battery
Battery Total Discharge Time	The cumulative battery discharge time
Battery type	Battery type of the UPS system
Battery Voltage Abnormal	Battery voltage out-of-range in the online lithium battery cabinet.
Bypass Backfeed Detected	The system detected a voltage on the bypass when none was expected
Bypass Input Frequency	The bypass input frequency
Bypass Input Voltage Fault	The system has detected the bypass voltage is unqualified.
Bypass Input Voltage RMS L1-L2	The bypass input RMS voltage between Lines 1 and 2
Bypass Input Voltage RMS L1-N	The bypass input RMS voltage between Line 1 and Neutral
Bypass Input Voltage RMS L2-L3	The bypass input RMS voltage between Lines 2 and 3
Bypass Input Voltage RMS L2-N	The bypass input RMS voltage between Line 2 and Neutral
Bypass Input Voltage RMS L3-L1	The bypass input RMS voltage between Lines 3 and 1
Bypass Input Voltage RMS L3-N	The bypass input RMS voltage between Line 3 and Neutral
Bypass Nominal Voltage	Bypass nominal (or rated) voltage
Bypass Not Available	A problem associated with the bypass has been detected
Charger Failure	Charger Failure - Charger is off
DC Bus Abnormal	The system has detected an abnormal DC Bus Voltage.
DC Bus Nominal Voltage	The nominal (or rated) voltage between the positive and negative terminals of the DC bus at the battery input
DC Bus Voltage	The voltage between the positive and negative terminals of the DC bus at the battery input

Table 3.145 Liebert® EXS and Liebert® ITA2—Glossary (continued)

Data Label	Data Description
DC to DC Converter Fault	A failure has occurred in the battery discharge circuit.
Device Faults were cleared as requested	Device Faults were cleared as requested
Dischargeable Battery Count Less Than Configured Number	The number of connected battery cabinets is less than the configured number. Prevent Discharge.
ECO Mode Operation State	This setting is used to enable or disable ECO Mode.
ECO Mode Status	Current ECO Mode Status
Emergency Power Off - Latched	System output is off - 'Emergency Power Off (EPO) - latched' requires manual reset
Equipment Over Temperature	Equipment over temperature summary event
Fan Replaced	Fan has been replaced.
Fan Replacement Required	Fan replacement required.
General Fault	A general fault in the UPS has been detected.
Incompatible Battery Management System version	The Battery Management System software version is incompatible.
Inlet Air Temperature	The temperature of the inlet air
Input Energy	Input energy consumption since the last reset of this value.
Input Frequency Deviation	The input frequency is outside of the normal range.
Input Source Backfeed	The battery is backfeeding the input source.
Input Wiring Fault	The neutral/ground conductors on the input wiring are not properly bonded, or the line/neutral conductors have been swapped.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Inverter Failure	Inverter failure - inverter output is off
Inverter On/Off State	inverter on/off state
Inverter Relay Fault	The inverter relay has malfunctioned.
Lithium Battery Cabinet Address Set Error	Lithium battery cabinet addresses have been set incorrectly.
Lithium Battery Cabinet Check	Check if the battery is present
Lithium Battery Cabinet Communication Failure	Battery cabinet communication has been disrupted.
Lithium Battery Cabinet mismatch the unit.	The warning is triggered when the online lithium battery cabinet can't be used by the UPS.
Lithium Battery Cabinet Online Number Error	The online battery cabinet number is different from the configured number.
Lithium Battery Cabinet State of Charge	State of charge of the online lithium battery cabinet.
Lithium Battery Cabinet Wait Charge	The battery is waiting for charge.
Lithium Battery Cable Connection Issue	Check the Lithium Battery cable connections.

Table 3.145 Liebert® EXS and Liebert® ITA2—Glossary (continued)

Data Label	Data Description
Lithium Battery Cell Capacity Low	Lithium battery cell capacity is very low.
Lithium Battery EOL	Lithium battery is at the end of its life.
Lithium Battery Hardware Circuit Protection Active	Lithium battery has activated hardware circuit protection.
Lithium Battery Manual Wake up Event	The event of Wake up lithium battery manually
Lithium Battery Manual Wake-up	Wake up the lithium battery manually
Lithium Battery Sampling Circuit Failure	Lithium battery has sampling circuit failure.
Lithium Battery Status.	State of the selected Lithium Battery Cabinet.
Lithium-Ion Battery System Abnormal	Lithium-Ion Battery System Abnormal
Load Sharing Fault	Difference between any phase inverter current of unit and the relevant average output current of parallel system is more than a specific percent of nominal current.
Loss of Redundancy	The multi-module collection doesn't have enough modules to satisfy the redundancy configuration.
Low Battery Warning Time	When battery time remaining falls to, or below, this value the low battery alarm is activated.
Maintenance Bypass Breaker Closed	The maintenance bypass breaker is closed.
Manual Battery Test	Command to initiate a manual battery test.
Maximum Cell Voltage	The maximum cell voltage of the paralleled lithium battery cabinets.
Minimum Cell Voltage	The minimum cell voltage of the paralleled lithium battery cabinets.
Nominal Battery Capacity	The nominal (or rated) battery capacity time at full load
Nominal Power Factor	The nominal (or rated) system power factor.
Number of EBC Installed	The total number of Extended Battery Cabinets installed.
Number of Lithium Battery Cabinets Over Limit	The number of batteries connected to the system exceeds the maximum
Number of parallel units	The number of modules in a parallel system
Outlet Group Identifier	A runtime assigned outlet group identification number
Outlet Group Power Control	Outlet Group Power Control (OFF, ON, Cycle, etc)
Output Apparent Power Rating	Output apparent power rating
Output Breaker Open	UPS internal or external output breaker is open.
Output Current Crest Factor L1	Output current crest factor of Line 1
Output Current Crest Factor L2	Output current crest factor of Line 2
Output Current Crest Factor L3	Output current crest factor of Line 3
Output Energy	Total accumulated energy output, since last energy reset.
Output On Delay	When a value is written to this point the output will be turned on after the specified time has elapsed.
Output Overload	An overload exists on the output.
Parallel Comm Warning	Parallel communication bus warning

Table 3.145 Liebert® EXS and Liebert® ITA2—Glossary (continued)

Data Label	Data Description
Parallel ID	Parallel Unit ID
Parallel Output Apparent Power	The sum total apparent power of a parallel system
Parallel Output Power	The sum total output power of a parallel system
Reboot With Delay	When a value is written to this point the output will be turned off immediately and then turned back on after the specified time has elapsed.
Rectifier Failure	Rectifier failure - rectifier is off
Replace Battery	The battery is due for replacement.
Reset Power Statistics	Reset Power Statistics
Server Class	The general classification for this system
Shutdown After Delay	When a value is written to this point the system will shutdown after the specified time has elapsed and output will remain off.
Shutdown Pending	Shutdown is pending.
Shutdown Reason	The reason for the most recent shutdown
Silence Audible Alarm	Silence Audible Alarm
System Capacity	System capacity supported by the installed power modules.
System Fan Failure	System fan failure - one or more fans have failed
System Input Black Out Count	The number of occurrences, since the last reset, where the input was not qualified to provide power to the system
System Input Brown Out Count	The number of occurrences, since the last reset, where the system input voltage has fallen below a pre-determined threshold for a specified amount of time
System Input Current Limit	The RMS input current has reached the input current limit threshold
System Input Frequency	The system input frequency
System Input Max Voltage L1-N	The maximum system input voltage measurement for Line 1-N since the last reset
System Input Max Voltage L2-N	The maximum system input voltage measurement for Line 2-N since the last reset
System Input Max Voltage L3-N	The maximum system input voltage measurement for Line 3-N since the last reset
System Input Min Voltage L1-N	The minimum system input voltage measurement for Line 1-N since the last reset
System Input Min Voltage L2-N	The minimum system input voltage measurement for Line 2-N since the last reset
System Input Min Voltage L3-N	The minimum system input voltage measurement for Line 3-N since the last reset
System Input Nominal Current	The nominal (or rated) system input current
System Input Nominal Frequency	The nominal (or rated) system input frequency
System Input Nominal Voltage	The nominal (or rated) system input voltage
System Input Phase Count	The number of phases for the system input
System Input Power Factor L1	The system input power factor for Line 1
System Input Power Factor L2	The system input power factor for Line 2

Table 3.145 Liebert® EXS and Liebert® ITA2—Glossary (continued)

Data Label	Data Description
System Input Power Factor L3	The system input power factor for Line 3
System Input Power Phase A	The system input power on phase A
System Input Power Phase B	The system input power on phase B
System Input Power Phase C	The system input power on phase C
System Input Power Problem	The input is not qualified to provide power to the system
System Input RMS Current L1	The system input RMS current for Line 1
System Input RMS Current L2	The system input RMS current for Line 2
System Input RMS Current L3	The system input RMS current for Line 3
System Input RMS L1-L2	The System Input RMS Voltage between Line 1 and Line 2
System Input RMS L1-N	The System Input RMS Voltage between Line 1 and Neutral
System Input RMS L2-L3	The System Input RMS Voltage between Line 2 and Line 3
System Input RMS L2-N	The System Input RMS Voltage between Line 2 and Neutral
System Input RMS L3-L1	The System Input RMS Voltage between Line 3 and Line 1
System Input RMS L3-N	The System Input RMS Voltage between Line 3 and Neutral
System Output Apparent Power L1	System output apparent power on Line 1
System Output Apparent Power L2	System output apparent power on Line 2
System Output Apparent Power L3	System output apparent power on Line 3
System Output Apparent Power	The sum total apparent power of all system output phases
System Output Fault	A fault has been detected in the system output
System Output Frequency	The system output frequency
System output Inhibit - Ext	System output is inhibited by an external signal
System Output Nominal Frequency	The nominal (or rated) system output frequency
System Output Nominal Voltage	The nominal (or rated) system output voltage
System Output Off	The system output is off
System Output Pct Power L1	The system output power on Line 1 as a percentage of the rated capacity
System Output Pct Power L2	The system output power on Line 2 as a percentage of the rated capacity
System Output Pct Power L3	The system output power on Line 3 as a percentage of the rated capacity
System Output Pct Power	The system output power as a percentage of the rated capacity.
System Output Power Factor L1	The system output power factor of Line 1
System Output Power Factor L2	The system output power factor of Line 2
System Output Power Factor L3	The system output power factor of Line 3
System Output Power L1	The system output power on Line 1.

Table 3.145 Liebert® EXS and Liebert® ITA2—Glossary (continued)

Data Label	Data Description
System Output Power L2	The system output power on Line 2.
System Output Power L3	The system output power on Line 3.
System Output Power	The sum total power of all system output phases
System Output RMS Current L1	The system output RMS current for Line 1
System Output RMS Current L2	The system output RMS current for Line 2
System Output RMS Current L3	The system output RMS current for Line 3
System Output Voltage RMS L1-L2	The system output RMS voltage between Lines 1 and 2
System Output Voltage RMS L1-N	The system output RMS voltage between Line 1 and Neutral
System Output Voltage RMS L2-L3	The system output RMS voltage between Lines 2 and 3
System Output Voltage RMS L2-N	The system output RMS voltage between Line 2 and Neutral
System Output Voltage RMS L3-L1	The system output RMS voltage between Lines 3 and 1
System Output Voltage RMS L3-N	The system output RMS voltage between Line 3 and Neutral
System Shutdown - Output Short	Shutdown was due to a short on the output.
System Status	The operating status for the system
Total Number of Battery Discharges	The total number of battery discharges.
Total System Operating Time	The cumulative operation time of the unit
Unspecified General Event	One or more unspecified events active. See local unit display for further details.
UPS Battery Status	UPS battery status
UPS is in Service Mode	UPS is in Service Mode
UPS Output on Bypass	The output power is supplied by the bypass
UPS Output Source	UPS output source
UPS Topology	UPS Topology
UPS was reset to factory defaults	UPS was reset to factory defaults

Silence Audible Alarm	—	40537	1	—	1 = Silence Alarm

Table 3.148 Liebert® MTP—Glossary

Data Label	Data Description
Audible Alarm Control	Audible Alarm Control
Auto Restart	When 'enabled', the UPS will automatically restart the load when utility power is restored after a battery discharge.
Battery Charge Status	Battery charge status.
Battery Discharge Time	The time on battery operation for this discharge
Battery Discharging	The battery is discharging
Battery EoD Voltage	When the battery voltage falls to or below this value, the battery becomes unqualified (it can't support the load).
Battery Fault	A short circuit exists in the battery system.
Battery Float Voltage	The cell voltage of the battery at float recharging.
Battery Low	The calculated battery time remaining has reached the low battery threshold

Table 3.148 Liebert® MTP—Glossary (continued)

Data Label	Data Description
Battery Percentage Charge	The percentage of battery charge
Battery Self Test	Battery self test is in progress
Battery Temperature for Cabinet	The battery temperature for a cabinet
Battery Test Failed	Battery test failed
Battery Test Result	The outcome of the previous battery test.
Battery Time Remaining	The calculated available time on battery
Bypass - Excess Auto Retransfers	The number of auto retransfers, from bypass to inverter, has exceeded the maximum for a specified time interval
Bypass Input Frequency	The bypass input frequency
Bypass Input RMS Current Phase A	The bypass input RMS current for Phase A.
Bypass Input RMS Current Phase B	The bypass input RMS current for Phase B.
Bypass Input RMS Current Phase C	The bypass input RMS current for Phase C.
Bypass Input Voltage RMS A-B	The bypass input RMS voltage between phases A and B
Bypass Input Voltage RMS A-N	The bypass input RMS voltage between phase A and Neutral
Bypass Input Voltage RMS B-C	The bypass input RMS voltage between phases B and C
Bypass Input Voltage RMS B-N	The bypass input RMS voltage between phase B and Neutral
Bypass Input Voltage RMS C-A	The bypass input RMS voltage between phases C and A
Bypass Input Voltage RMS C-N	The bypass input RMS voltage between phase C and Neutral
Bypass Not Available	A problem associated with the bypass has been detected
Bypass SCR Open	The bypass SCR is in an open circuit condition.
Bypass SCR Short	The bypass SCR is in short circuit condition.
Charger Failure	Charger Failure - Charger is off
DC Bus Low Fault	The DC Bus voltage has reached a critical low level.
DC Bus Nominal Voltage	The nominal (or rated) voltage between the positive and negative terminals of the DC bus at the battery input
DC Bus Voltage	The voltage between the positive and negative terminals of the DC bus at the battery input
DC Converter Status	The operating state of the dc converter.
ECO Mode Operation State	This setting is used to enable or disable ECO Mode.
ECO Mode Status	Current ECO Mode Status
Emergency Power Off (EPO) Logic	Emergency Power Off (EPO) Logic
Equipment Over Temperature	Equipment over temperature summary event
Input Frequency Deviation	The input frequency is outside of the normal range.
Input Overvoltage	One or more of the input phase voltages has exceeded the limit.
Input Undervoltage	One or more of the input phase voltages has dropped below the limit.

Table 3.148 Liebert® MTP—Glossary (continued)

Data Label	Data Description
Inverter Communications Failure	Communication between internal monitor and Inverter has failed.
Inverter Failure	Inverter failure - inverter output is off
Inverter On/Off State	inverter on/off state
Inverter Over Temperature	Inverter temperature is too high to keep inverter running.
Inverter Overload	Inverter in overload fault
Inverter Temperature	Temperature measured at the inverter.
Manual Battery Test	Command to initiate a manual battery test.
Nominal Power Factor	The nominal (or rated) system power factor.
Output Apparent Power Rating	Output apparent power rating
Output Load on Maint. Bypass	The output power is supplied by the maintenance bypass
Output Overload	An overload exists on the output.
Output Overvoltage	One or more of the output phase voltages has exceeded the limit.
Output Undervoltage	One or more of the output phase voltages has dropped below the limit.
Outside Air Temperature	Ambient outside air temperature.
PFC Temperature	Temperature measured at the Power Factor Correction circuit.
Power Factor Correction	The state of the power factor correction circuitry of the system
Precharge Circuit Failed	DC Bus precharge/discharge didn't reach specified level within a specified time.
Rectifier Communications Failure	Communication between internal monitor and Rectifier has failed.
Rectifier Failure	Rectifier failure - rectifier is off
Rectifier Over Temperature	Rectifier temperature is too high to keep rectifier running.
Rectifier Overcurrent Warning	The rectifier stopped for overcurrent
Replace Battery	The battery is due for replacement.
Shutdown Pending	Shutdown is pending.
Shutdown Reason	The reason for the most recent shutdown
Silence Audible Alarm	Silence Audible Alarm
System Input Frequency	The system input frequency
System Input Nominal Current	The nominal (or rated) system input current
System Input Nominal Frequency	The nominal (or rated) system input frequency
System Input Nominal Voltage	The nominal (or rated) system input voltage
System Input Phs Rotation Error	The power conductors on the input line are not wired to the UPS in the sequence preferred for the rectifier (A-B-C)
System Input Power Problem	The input is not qualified to provide power to the system
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B

Table 3.148 Liebert® MTP—Glossary (continued)

Data Label	Data Description
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Input RMS Current Phase A	The system input RMS current for Phase A
System Input RMS Current Phase B	The system input RMS current for Phase B
System Input RMS Current Phase C	The system input RMS current for Phase C
System Output Apparent Power Phs A	System output apparent power on phase A
System Output Apparent Power Phs B	System output apparent power on phase B
System Output Apparent Power Phs C	System output apparent power on phase C
System Output Apparent Power	The sum total apparent power of all system output phases
System Output Frequency	The system output frequency
System Output Nominal Frequency	The nominal (or rated) system output frequency
System Output Nominal Voltage	The nominal (or rated) system output voltage
System Output Off	The system output is off
System Output Pct Power Phase A	The system output power on phase A as a percentage of the rated capacity
System Output Pct Power Phase B	The system output power on phase B as a percentage of the rated capacity
System Output Pct Power Phase C	The system output power on phase C as a percentage of the rated capacity
System Output Pct Power	The system output power as a percentage of the rated capacity.
System Output Power Phase A	The system output power on phase A.
System Output Power Phase B	The system output power on phase B.
System Output Power Phase C	The system output power on phase C.
System Output Power	The sum total power of all system output phases
System Output RMS Current Phs A	The system output RMS current for Phase A
System Output RMS Current Phs B	The system output RMS current for Phase B
System Output RMS Current Phs C	The system output RMS current for Phase C
System Output Voltage RMS A-B	The system output RMS voltage between phases A and B
System Output Voltage RMS A-N	The system output RMS voltage between phases A and Neutral
System Output Voltage RMS B-C	The system output RMS voltage between phases B and C
System Output Voltage RMS B-N	The system output RMS voltage between phases B and Neutral

Table 3.148 Liebert® MTP—Glossary (continued)

Data Label	Data Description
System Output Voltage RMS C-A	The system output RMS voltage between phases C and A
System Output Voltage RMS C-N	The system output RMS voltage between phases C and Neutral
System Status	The operating status for the system
Unspecified General Event	One or more unspecified events active. See local unit display for further details.
UPS Battery Status	UPS battery status
UPS Output on Bypass	The output power is supplied by the bypass
UPS Output Source	UPS output source
UPS Topology	UPS Topology

Table 3.149 Liebert® Nfinity—Status and Coil

Data Description	Status	Coil	Number of Bits	Scale	Notes / Units

System Input Nominal Frequency	30689	—	1	—	Units : Hz Uint16

Table 3.157 Liebert® NX 225-600kVA UPS—IS-UNITY-DP—Glossary

Data Label	Data Description
Backfeed Breaker Open	The backfeed breaker is in the open position
Battery Auto Test In Progress	Automatic battery test is in progress
Battery Breaker Open	The battery circuit is open.
Battery Discharging	The battery is discharging
Battery Ground Fault	Battery system ground fault amperage exceeds the threshold
Battery Low	The calculated battery time remaining has reached the low battery threshold
Battery Manual Test In Progress	Manual battery test is in progress
Battery Over Temperature	A battery temperature sensor is reporting a value above a threshold
Battery Over Voltage	The system has detected that the battery voltage has exceeded a predetermined limit.
Battery Percentage Charge	The percentage of battery charge
Battery Recharge Voltage	The recharge cell voltage for the battery.
Battery Temperature for Cabinet	The battery temperature for a cabinet
Battery Temperature Out of Range	Battery temperature is outside of acceptable range.
Battery Terminals Reversed	The measured battery voltage is a negative value due to reverse battery terminal connections.
Battery Test Failed	Battery test failed
Battery Test Passed	Battery test passed
Battery Time Remaining	The calculated available time on battery
Battery Volts for Cabinet	The voltage between the positive and negative battery terminals of a battery cabinet
Booster Failure	Booster failure - boost is off
Booster On/Off State	Booster on/off state
Booster-Charger Temperature	Temperature measured at the charger stage

Table 3.157 Liebert® NX 225-600kVA UPS—IS-UNITY-DP—Glossary (continued)

Data Label	Data Description
Bypass Input Frequency	The bypass input frequency
Bypass Input Voltage Fault	The system has detected the bypass voltage is unqualified.
Bypass Input Voltage RMS A-B	The bypass input RMS voltage between phases A and B
Bypass Input Voltage RMS B-C	The bypass input RMS voltage between phases B and C
Bypass Input Voltage RMS C-A	The bypass input RMS voltage between phases C and A
Bypass Not Available	A problem associated with the bypass has been detected
Bypass Overload	Bypass overloaded, reduce load immediately.
Bypass Qualification Status	bypass qualification status
Bypass Static Switch Unavailable	The static bypass is unavailable to support the critical load.
Charger Failure	Charger Failure - Charger is off
Charger On/Off State	Charger on/off state
DC Bus Abnormal	The system has detected an abnormal DC Bus Voltage.
DC Bus Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value
DC Bus Qualification Status	dc bus qualification status
DC Bus Voltage	The voltage between the positive and negative terminals of the internal DC Bus.
ECO Mode Operation State	This setting is used to enable or disable ECO Mode.
Equipment Over Temperature	Equipment over temperature summary event
Fan Hours Exceeded	Operating hours for the unit blower fan have exceeded the threshold.
Generic DIC Fault	The control board reports a fault - Service required.
Generic Test Event	A generic test event designed to evaluate system handling of events
Ground Fault	An AC phase to ground fault or three phase fault to ground exists on the output of the UPS.
Inlet Air Over Temperature	The inlet air exceeds the maximum temperature threshold
Input Breaker Open	The main input breaker is open.
Inverter Desaturation	Inverter Desaturation
Inverter Failure	Inverter failure - inverter output is off
Inverter On/Off State	inverter on/off state
Inverter Overload Time Remaining	The calculated time remaining before inverter shutdown
Inverter Overload	Inverter in overload fault
Inverter Phase A Temperature sensor	Inverter temperature sensor reading for Phase A.

Table 3.157 Liebert® NX 225-600kVA UPS—IS-UNITY-DP—Glossary (continued)

Data Label	Data Description
Inverter Phase B Temperature sensor	Inverter temperature sensor reading for Phase B.
Inverter Phase C temperature sensor	Inverter temperature sensor reading for Phase C.
Inverter Synchronization Source	The reference source for inverter synchronization
Load Power Source	Load power source
Main Controller Fault	A Main Controller fault has been detected.
Maintenance Bypass Breaker Closed	The maintenance bypass breaker is closed.
Max Charge Current	The maximum allowed current to be used for charging the batteries.
Maximum Load Alarm	Maximum load alarm indicating load setting has been exceeded.
Output Apparent Power Rating	Output apparent power rating
Output Breaker Open	The output breaker is open.
Output Load on Maint. Bypass	The output power is supplied by the maintenance bypass
Output Of/Uf	The output frequency has exceeded a specified range for a specified period of time.
Output Percent Load	The percentage of the system's total rated output current that is flowing from the system.
Rectifier Failure	Rectifier failure - rectifier is off
Rectifier Phase A Temperature sensor	Rectifier temperature sensor reading for Phase A.
Rectifier Phase B Temperature sensor	Rectifier temperature sensor reading for Phase B.
Rectifier Phase C Temperature sensor	Rectifier temperature sensor reading for Phase C.
Rectifier Status	rectifier status
Static Bypass Switch	Static Bypass Switch state - On/Off
System Input Current Limit	The RMS input current has reached the input current limit threshold
System Input Frequency	The system input frequency
System Input Nominal Frequency	The nominal (or rated) system input frequency
System Input Nominal Voltage	The nominal (or rated) system input voltage
System Input Phs Rotation Error	The power conductors on the input line are not wired to the UPS in the sequence preferred for the rectifier (A-B-C)
System Input Power Problem	The input is not qualified to provide power to the system
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B

Table 3.157 Liebert® NX 225-600kVA UPS—IS-UNITY-DP—Glossary (continued)

Data Label	Data Description
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A
System Input RMS Current Phase A	The system input RMS current for Phase A
System Input RMS Current Phase B	The system input RMS current for Phase B
System Input RMS Current Phase C	The system input RMS current for Phase C
System Output Apparent Power Phs A	System output apparent power on phase A
System Output Apparent Power Phs B	System output apparent power on phase B
System Output Apparent Power Phs C	System output apparent power on phase C
System Output Apparent Power	The sum total apparent power of all system output phases
System Output Fault	A fault has been detected in the system output
System Output Frequency	The system output frequency
System Output Off	The system output is off
System Output Pct Power Phase A	The system output power on phase A as a percentage of the rated capacity
System Output Pct Power Phase B	The system output power on phase B as a percentage of the rated capacity
System Output Pct Power Phase C	The system output power on phase C as a percentage of the rated capacity
System Output Power Phase A	The system output power on phase A.
System Output Power Phase B	The system output power on phase B.
System Output Power Phase C	The system output power on phase C.
System Output Power	The sum total power of all system output phases
System Output RMS Current Phs A	The system output RMS current for Phase A
System Output RMS Current Phs B	The system output RMS current for Phase B
System Output RMS Current Phs C	The system output RMS current for Phase C
System Output Voltage RMS A-B	The system output RMS voltage between phases A and B

Table 3.157 Liebert® NX 225-600kVA UPS—IS-UNITY-DP—Glossary (continued)

Data Label	Data Description
System Output Voltage RMS B-C	The system output RMS voltage between phases B and C
System Output Voltage RMS C-A	The system output RMS voltage between phases C and A
System Shutdown - EPO	System shutdown due to Emergency Power Off (EPO)
System Shutdown - Output Short	Shutdown was due to a short on the output.
System Status	The operating status for the system
Temperature	Temperature measured at the temperature sensor
Unit Shutdown	An event has occurred requiring the unit to be shutdown and disabled to prevent damage to the system.
UPS battery1 status	UPS battery status
UPS Operating Mode	UPS Operating Mode
UPS Output on Bypass	The output power is supplied by the bypass
UPS Output Source	UPS output source

Table 3.158 Liebert® NXL—60Hz, UL version (Model 40)—Status and Coil

Data Label	Status	Coil	# of Bits	Notes	NXL Type
Battery Self Test	10082	—	1	Active on Alarm	SMS, 1+N, N+1, 1+1

Battery						
Total Number of Battery Discharges	30821		1		Uint16	SMS, 1+N, N+1, 1+1
Bypass						
Total Bypass Operating Time	30830		2		Units : hr Uint32	SMS, 1+N, SCC, 1+1
If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.						

Table 3.160 Liebert® NXL—60Hz, UL version (Model 40)—Glossary

Data Label	Data Description
Auto Restart In Progress	Auto restart is in progress
Auto Restart Inhibited - Ext	Auto restart inhibited due to an external signal
Auto Retransfer Time Remaining	Time remaining before an inverter overload or inverter fault can be cleared and auto retransfer from the bypass to the inverter can take place
Automatic Restart Failed	Automatic restart failed
Backfeed Breaker Open	The backfeed breaker is in the open position
Backfeed Breaker	Backfeed breaker

Table 3.160 Liebert® NXL—60Hz, UL version (Model 40)—Glossary (continued)

Data Label	Data Description
Battery - External Monitor 1	External battery monitor 1 - battery maintenance required
Battery - External Monitor 2	External battery monitor 2 - battery maintenance required
Battery Amp-Hours Consumed This Discharge	Battery amp-hours withdrawn this discharge.
Battery Amp-Hours Consumed	Cumulative battery amp-hours withdrawn over the life of the battery
Battery Capacity Low	Battery capacity is low
Battery Cell Count - Lead Acid	Battery cell count - lead acid
Battery Cell Count-Nickel Cadmium	Battery cell count - nickel cadmium
Battery Charging	The UPS battery is charging (battery charge percentage lower than 98)
Battery Charging Inhibited	Battery charging is inhibited due to an external inhibit signal
Battery Charging Reduced-Extrnl	Using a reduced battery charging algorithm due to an external signal
Battery Circuit Breaker 1 Open	Battery circuit breaker 1 is open
Battery Circuit Breaker 2 Open	Battery circuit breaker 2 is open
Battery Circuit Breaker 3 Open	Battery circuit breaker 3 is open
Battery Circuit Breaker 4 Open	Battery circuit breaker 4 is open
Battery Circuit Breaker 5 Open	Battery circuit breaker 5 is open
Battery Circuit Breaker 6 Open	Battery circuit breaker 6 is open
Battery Circuit Breaker 7 Open	Battery circuit breaker 7 is open
Battery Circuit Breaker 8 Open	Battery circuit breaker 8 is open
Battery Commission Date	Date and time when battery placed into service
Battery Discharge Power	Instantaneous battery power while discharging
Battery Discharge Time	The time on battery operation for this discharge
Battery Discharging	The battery is discharging
Battery Equalize	The rectifier output voltage is increased to equalize the battery voltage level.
Battery Ground Fault	Battery system ground fault amperage exceeds the threshold
Battery Last Discharge Date	The date and time of the last battery discharge
Battery Low Shutdown	Battery disconnect due to end-of-discharge.
Battery Low	The calculated battery time remaining has reached the low battery threshold
Battery Over Temperature	A battery temperature sensor is reporting a value above a threshold
Battery Percentage Charge	The percentage of battery charge
Battery Self Test	Battery self test is in progress
Battery Temperature for Cabinet	The battery temperature for a cabinet

Table 3.160 Liebert® NXL—60Hz, UL version (Model 40)—Glossary (continued)

Data Label	Data Description
Battery Temperature Imbalance	Excessive temperature differences between battery sensors detected
Battery Temperature Sensor Fault	A battery temperature sensor fault has been detected
Battery Test Failed	Battery test failed
Battery Test Inhibited	Automatic (scheduled) battery tests are inhibited
Battery Time Remaining	The calculated available time on battery
Battery Total Discharge Time	The cumulative battery discharge time
Battery Volts at Main Disconnect	The voltage between the positive and the negative battery terminals of the common battery disconnect
Battery Volts for Cabinet	The voltage between the positive and negative battery terminals of a battery cabinet
Bypass - Excess Auto Retransfers	The number of auto retransfers, from bypass to inverter, has exceeded the maximum for a specified time interval
Bypass - Manual Rexfr Inhibited	Manual transfer from bypass to inverter is inhibited.
Bypass - Manual Xfr Inhibited	Manual transfer from inverter to bypass is inhibited.
Bypass Auto Retransfer Failed	After performing a recoverable transfer to bypass, an attempt to auto retransfer from bypass to inverter failed
Bypass Auto Transfer Failed	An automatic transfer to static bypass failed
Bypass Excessive Pulse Parallel	The system has performed too many pulse parallel operations within a specified time interval
Bypass Frequency Error	The bypass frequency is outside the inverter synchronization limits
Bypass Input Frequency	The bypass input frequency
Bypass Input Voltage RMS A-B	The bypass input RMS voltage between phases A and B
Bypass Input Voltage RMS B-C	The bypass input RMS voltage between phases B and C
Bypass Input Voltage RMS C-A	The bypass input RMS voltage between phases C and A
Bypass Isolation Breaker (BIB)	Bypass isolation breaker (BIB)
Bypass Nominal Voltage	Bypass nominal (or rated) voltage
Bypass Not Available	A problem associated with the bypass has been detected
Bypass Overload Phase A	An overload exists on output phase A while operating on the bypass
Bypass Overload Phase B	An overload exists on output phase B while operating on the bypass
Bypass Overload Phase C	An overload exists on output phase C while operating on the bypass
Bypass Qualification Status	bypass qualification status
Bypass SS Overload Time Remain	The calculated time remaining before bypass static switch shutdown due to the present overload condition
Bypass Static Switch Off Extrnl	Bypass static switch is off due to the state of an external signal
Bypass Static Switch Overload	Bypass off due to static switch overload
Bypass Static Switch Unavailable	The static bypass switch is off, and unable to operate
Bypass Sync Phase Difference	The phase angle difference between the inverter output and bypass source
Controls Reset Required	A controls reset is required due to one or more critical settings changing
DC Bus Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging

Table 3.160 Liebert® NXL—60Hz, UL version (Model 40)—Glossary (continued)

Data Label	Data Description
	mode, the current will be a negative value
DC Bus Ground Fault - Negative	A ground fault has been detected on the negative DC Bus link
DC Bus Ground Fault - Positive	A ground fault has been detected on the positive DC Bus link
DC Bus Qualification Status	DC bus qualification status
DC Bus Voltage	The voltage between the positive and negative terminals of the DC bus at the battery input
Equipment Over Temperature	Equipment over temperature summary event
Equipment Temperature Sensor Fail	One or more temperature sensors report a temperature outside of the range of expected operation.
Fuse Failure	A summary event indicating one or more fuse failures
Inlet Air Over Temperature	The inlet air exceeds the maximum temperature threshold
Inlet Air Temperature	The temperature of the inlet air
Input Breaker (CB1/RIB)	Input breaker (CB1/RIB)
Input Contact 01	The external input contact 1
Input Contact 02	The external input contact 2
Input Contact 03	The external input contact 3
Input Contact 04	The external input contact 4
Input Contact 05	The external input contact 5
Input Contact 06	The external input contact 6
Input Contact 07	The external input contact 7
Input Contact 08	The external input contact 8
Input Contact 09	The external input contact 9
Input Contact 10	The external input contact 10
Input Contact 11	The external input contact 11
Input Contact 12	The external input contact 12
Input Contact 13	The external input contact 13
Input Contact 14	The external input contact 14
Input Contact 15	The external input contact 15
Input Contact 16	The external input contact 16
Input Filter Cycle Lock	The input filter disconnect is open due to exceeding the maximum number of cycles.
Input Isolation Transformer	Input isolation transformer
Input Qualification Status	input qualification status
Internal Bypass Breaker (CB3)	Internal bypass breaker (CB3)
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus

Table 3.160 Liebert® NXL—60Hz, UL version (Model 40)—Glossary (continued)

Data Label	Data Description
Inverter Failure	Inverter failure - inverter output is off
Inverter Inhibit - External	Restart of the inverter is inhibited by an external signal
Inverter Off - External	Inverter is off (operation is inhibited) due to external signal state
Inverter On/Off State	inverter on/off state
Inverter Output Qualification Status	inverter output qualification status
Inverter Overload Phase A	Inverter is operating with an overload on phase A
Inverter Overload Phase B	Inverter is operating with an overload on phase B
Inverter Overload Phase C	Inverter is operating with an overload on phase C
Inverter Overload Time Remaining	The calculated time remaining before inverter shutdown
Inverter Shutdown - Overload	The inverter has shutdown due to a sustained overload
Inverter Static Switch SCR Short	The system has detected a short across one or more inverter static switch Silicon Controlled Rectifiers (SCR)
LBS Inhibited	The system has detected that conditions to perform Load Bus Sync are not satisfied
Leading Power Factor	The leading output Power Factor has fallen below a specified value
Main Battery Disconnect Open	Main battery disconnect is open
Main Controller Fault	A Main Controller fault has been detected.
Maintenance Bypass Breaker (MBB)	Maintenance bypass breaker (MBB)
Maintenance Isolation Breaker (MIB)	Maintenance isolation breaker (MIB)
Module Output Breaker (MOB)	Module output breaker (MOB)
Multiple Fan Failure	Multiple fan failure
On Generator	A generator is supplying the power to the system
Output Amp Over User Limit-Phs A	The phase A output has exceeded the user amperage threshold
Output Amp Over User Limit-Phs B	The phase B output has exceeded the user amperage threshold
Output Amp Over User Limit-Phs C	The phase C output has exceeded the user amperage threshold
Output Apparent Power Rating	Output apparent power rating
Output Breaker (CB2/IOB)	Output breaker (CB2/IOB)
Output Load on Maint. Bypass	The output power is supplied by the maintenance bypass
Output Qualification Status	output qualification status
Output Real Power Rating	Output real power rating
Output Series Static Switch	output series static switch
Output Wire Configuration	Output wire configuration
Power Supply Failure	Power supply failure

Table 3.160 Liebert® NXL—60Hz, UL version (Model 40)—Glossary (continued)

Data Label	Data Description
Rectifier Active Filter	Rectifier input active filter configuration
Rectifier Failure	Rectifier failure - rectifier is off
Rectifier Feed Breaker (RFB)	Rectifier feed breaker (RFB)
Rectifier Input Passive Filter	Rectifier input passive filter configuration
Rectifier Operation Inhibit-Ext	The operation of the rectifier is inhibited by an external signal
Rectifier Passive Filter Switch	Rectifier input passive filter switch configuration
Rectifier Pulse Count	Rectifier pulse count per cycle configuration
Rectifier Status	rectifier status
SBS Load Disconnect	SBS load disconnect
Service Code Active	Service code is running
Static Bypass Switch	Static Bypass Switch state - On/Off
Static Switch Type	Static switch type configuration
System Breaker(s) Close Failure	One or more breakers in the system failed to close
System Breaker(s) Open Failure	One or more breakers in the system failed to open
System Controller Error	System controller internal error
System Date and Time	The system date and time
System Fan Failure - Redundant	Redundant system fan failure
System Input Current Imbalance	System Input Currents are Imbalanced
System Input Current Limit	The RMS input current has reached the input current limit threshold
System Input Frequency	The system input frequency
System Input Nominal Frequency	The nominal (or rated) system input frequency
System Input Nominal Voltage	The nominal (or rated) system input voltage
System Input Phs Rotation Error	The power conductors on the input line are not wired to the UPS in the sequence preferred for the rectifier (A-B-C)
System Input Power Problem	The input is not qualified to provide power to the system
System Input Power Source	System input power source
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A
System Input RMS Current Phase A	The system input RMS current for Phase A
System Input RMS Current Phase B	The system input RMS current for Phase B
System Input RMS Current Phase C	The system input RMS current for Phase C
System Output Apparent Power	The sum total apparent power of all system output phases

Table 3.160 Liebert® NXL—60Hz, UL version (Model 40)—Glossary (continued)

Data Label	Data Description
System Output Fault	A fault has been detected in the system output
System Output Frequency	The system output frequency
System Output Low Power Factor	The system output power factor is low, resulting in reduced output capacity
System Output Maximum Amp Rating	System output maximum amperage rating
System Output Nominal Frequency	The nominal (or rated) system output frequency
System Output Nominal Voltage	The nominal (or rated) system output voltage
System Output Off	The system output is off
System Output Pct Power Phase A	The system output power on phase A as a percentage of the rated capacity
System Output Pct Power Phase B	The system output power on phase B as a percentage of the rated capacity
System Output Pct Power Phase C	The system output power on phase C as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs A	The system output apparent power on phase A as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs B	The system output apparent power on phase B as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs C	The system output apparent power on phase C as a percentage of the rated capacity
System Output Power Factor Phs A	The system output power factor of phase A
System Output Power Factor Phs B	The system output power factor of phase B
System Output Power Factor Phs C	The system output power factor of phase C
System Output Power	The sum total power of all system output phases
System Output RMS Current Phs A	The system output RMS current for Phase A
System Output RMS Current Phs B	The system output RMS current for Phase B
System Output RMS Current Phs C	The system output RMS current for Phase C
System Output Voltage RMS A-B	The system output RMS voltage between phases A and B
System Output Voltage RMS A-N	The system output RMS voltage between phases A and Neutral
System Output Voltage RMS B-C	The system output RMS voltage between phases B and C
System Output Voltage RMS B-N	The system output RMS voltage between phases B and Neutral
System Output Voltage RMS C-A	The system output RMS voltage between phases C and A
System Output Voltage RMS C-N	The system output RMS voltage between phases C and Neutral
System Shutdown - EPO	System shutdown due to Emergency Power Off (EPO)
System Shutdown - REPO	System shutdown due to Remote Emergency Power Off (REPO)
System Status	The operating status for the system
Thermal Margin Warning	The thermal margin has dropped below the threshold value
Total Bypass Operating Time	The cumulative bypass time of the unit.
Total System Operating Time	The cumulative operation time of the unit

Table 3.160 Liebert® NXL—60Hz, UL version (Model 40)—Glossary (continued)

Data Label	Data Description
Trap Filter Disconnect	Trap filter disconnect
UPS Battery Status	UPS battery status
UPS Module Type	UPS module type
UPS Output on Bypass	The output power is supplied by the bypass
UPS Output Source	UPS output source
UPS System Output Source	The UPS system's output power source

Table 3.161 Liebert® NXL—50Hz, CE version (Models 48 and 49)—Status and Coil

Data Description	Status	Coil	Number of Bits	Notes / Units

If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.

Table 3.163 Liebert® NXL—50Hz, CE version (Models 48 and 49)—Glossary

Data Label	Data Description
Auto Restart In Progress	Auto restart is in progress
Auto Restart Inhibited - Ext	Auto restart inhibited due to an external signal
Auto Retransfer Time Remaining	Time remaining before an inverter overload or inverter fault can be cleared and auto retransfer from the bypass to the inverter can take place
Automatic Restart Failed	Automatic restart failed
Backfeed Breaker Open	The backfeed breaker is in the open position
Backfeed Breaker	Backfeed breaker
Battery - External Monitor 1	External battery monitor 1 - battery maintenance required
Battery - External Monitor 2	External battery monitor 2 - battery maintenance required
Battery Amp-Hours Consumed This Discharge	Battery amp-hours withdrawn this discharge.
Battery Amp-Hours Consumed	Cumulative battery amp-hours withdrawn over the life of the battery
Battery Auto Test In Progress	Automatic battery test is in progress
Battery Automatic Test Inhibited	Automatic (scheduled) battery tests are inhibited
Battery Capacity Low	Battery capacity is low
Battery Cell Count - Lead Acid	Battery cell count - lead acid
Battery Cell Count-Nickel Cadmium	Battery cell count - nickel cadmium
Battery Charging	The UPS battery is charging (battery charge percentage lower than 98)
Battery Circuit Breaker 1 Open	Battery circuit breaker 1 is open
Battery Circuit Breaker 2 Open	Battery circuit breaker 2 is open
Battery Circuit Breaker 3 Open	Battery circuit breaker 3 is open
Battery Circuit Breaker 4 Open	Battery circuit breaker 4 is open
Battery Circuit Breaker 5 Open	Battery circuit breaker 5 is open

Table 3.163 Liebert® NXL—50Hz, CE version (Models 48 and 49)—Glossary (continued)

Data Label	Data Description
Battery Circuit Breaker 6 Open	Battery circuit breaker 6 is open
Battery Discharge Power	Instantaneous battery power while discharging
Battery Discharge Time	The time on battery operation for this discharge
Battery Discharging	The battery is discharging
Battery Equalize	The rectifier output voltage is increased to equalize the battery voltage level.
Battery Fuse Fault	One or more battery fuse faults has occurred.
Battery Ground Fault	Battery system ground fault amperage exceeds the threshold
Battery Last Discharge Date	The date and time of the last battery discharge
Battery Low Shutdown	The battery voltage has dropped to the End of Discharge value.
Battery Low	The calculated battery time remaining has reached the low battery threshold
Battery Over Temperature Limit	A battery temperature sensor is reporting a value above a predetermined limit.
Battery Over Temperature	A battery temperature sensor is reporting a value above a threshold
Battery Over Voltage	The system has detected that the battery voltage has exceeded a predetermined limit.
Battery Percentage Charge	The percentage of battery charge
Battery SCR Status	The status of the battery SCR.
Battery Temperature for Cabinet	The battery temperature for a cabinet
Battery Temperature Imbalance	Excessive temperature differences between battery sensors detected
Battery Temperature Sensor Fault	A battery temperature sensor fault has been detected
Battery Test Failed	Battery test failed
Battery Test Manually Stopped	The battery test was manually stopped prior to completion
Battery Test Passed	Battery test passed
Battery Time Remaining	The calculated available time on battery
Battery Total Discharge Time	The cumulative battery discharge time
Battery Volts at Main Disconnect	The voltage between the positive and the negative battery terminals of the common battery disconnect
Battery Volts for Cabinet	The voltage between the positive and negative battery terminals of a battery cabinet
Bypass - Manual Rexfr Inhibited	Manual transfer from bypass to inverter is inhibited.
Bypass - Manual Xfr Inhibited	Manual transfer from inverter to bypass is inhibited.
Bypass Auto Retransfer Failed	After performing a recoverable transfer to bypass, an attempt to auto retransfer from bypass to inverter failed
Bypass Auto Transfer Failed	An automatic transfer to static bypass failed

Table 3.163 Liebert® NXL—50Hz, CE version (Models 48 and 49)—Glossary (continued)

Data Label	Data Description
Bypass Frequency Error	The bypass frequency is outside the inverter synchronization limits
Bypass Input Frequency	The bypass input frequency
Bypass Input Voltage RMS A-B	The bypass input RMS voltage between phases A and B
Bypass Input Voltage RMS B-C	The bypass input RMS voltage between phases B and C
Bypass Input Voltage RMS C-A	The bypass input RMS voltage between phases C and A
Bypass Input Wire Configuration	Bypass input wire configuration
Bypass Isolation Breaker for Module 1	Bypass isolation breaker for module 1
Bypass Isolation Breaker for Module 2	Bypass isolation breaker for module 2
Bypass Isolation Breaker for Module 3	Bypass isolation breaker for module 3
Bypass Isolation Breaker for Module 4	Bypass isolation breaker for module 4
Bypass Isolation Breaker for Module 5	Bypass isolation breaker for module 5
Bypass Isolation Breaker for Module 6	Bypass isolation breaker for module 6
Bypass Isolation Breaker for Module 7	Bypass isolation breaker for module 7
Bypass Isolation Breaker for Module 8	Bypass isolation breaker for module 8
Bypass Isolation Breaker	Bypass isolation breaker
Bypass Nominal Voltage	Bypass nominal (or rated) voltage
Bypass Not Available	A problem associated with the bypass has been detected
Bypass Overload Phase A	An overload exists on output phase A while operating on the bypass
Bypass Overload Phase B	An overload exists on output phase B while operating on the bypass
Bypass Overload Phase C	An overload exists on output phase C while operating on the bypass
Bypass Qualification Status	bypass qualification status
Bypass SS Overload Time Remain	The calculated time remaining before bypass static switch shutdown due to the present overload condition
Bypass Static Switch Overload	Bypass off due to static switch overload
Bypass Static Switch Unavailable	The static bypass switch is off, and unable to operate
Bypass Sync Phase Difference	The phase angle difference between the inverter output and bypass source
Configuration Description	Configuration description

Table 3.163 Liebert® NXL—50Hz, CE version (Models 48 and 49)—Glossary (continued)

Data Label	Data Description
Continuous Operation - ECO Mode	This setting gives the user the ability to Enable/Disable ECO Mode continuous operation.
Controls Reset Required	A controls reset is required due to one or more critical settings changing
DC Bus Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value
DC Bus Low Fault	The DC Bus voltage has reached a critical low level.
DC Bus Qualification Status	dc bus qualification status
DC Bus Voltage	The voltage between the positive and negative terminals of the DC bus at the battery input
ECO Mode Active	Conditions for Activation or Automatic Reactivation have been satisfied.
ECO Mode Operation State	This setting is used to enable or disable ECO Mode.
ECO Mode Suspended	ECO Mode session is suspended.
EMO Shutdown	An Emergency Module Off command has been detected.
Equipment Temperature Sensor Fail	One or more temperature sensors report a temperature outside of the range of expected operation.
Excess ECO Suspends	Number of automatic suspensions has exceeded the ECO Mode - Maximum Auto Suspensions setting.
Fuse Failure	A summary event indicating one or more fuse failures
Inlet Air Over Temperature	The inlet air exceeds the maximum temperature threshold
Inlet Air Temperature	The temperature of the inlet air
Input Breaker	Input breaker
Input Contact 01	The external input contact 1
Input Contact 02	The external input contact 2
Input Contact 03	The external input contact 3
Input Contact 04	The external input contact 4
Input Contact 05	The external input contact 5
Input Contact 06	The external input contact 6
Input Contact 07	The external input contact 7
Input Contact 08	The external input contact 8
Input Contact 09	The external input contact 9
Input Contact 10	The external input contact 10
Input Contact 11	The external input contact 11
Input Contact 12	The external input contact 12
Input Contact 13	The external input contact 13
Input Contact 14	The external input contact 14
Input Contact 15	The external input contact 15

Table 3.163 Liebert® NXL—50Hz, CE version (Models 48 and 49)—Glossary (continued)

Data Label	Data Description
Input Contact 16	The external input contact 16
Input Filter Cycle Lock	The input filter disconnect is open due to exceeding the maximum number of cycles.
Input Isolation Transformer	Input isolation transformer
Input Qualification Status	input qualification status
Intelligent Parallel Maximum Time in Standby	The maximum time a module can be in standby mode due to Intelligent Paralleling.
Intelligent Parallel Minimum Redundancy	This is the minimum Number of Redundant Modules that the system will allow before bringing one or more modules back to normal operation and terminating Intelligent Paralleling.
Intelligent Parallel Operation State	This setting is used to enable or disable Intelligent Paralleling.
Internal Communications Failure	The control has detected a communication failure of a component on the internal communication bus
Inverter Failure	Inverter failure - inverter output is off
Inverter Inhibit - External	Restart of the inverter is inhibited by an external signal
Inverter On/Off State	inverter on/off state
Inverter Output Qualification Status	inverter output qualification status
Inverter Overload Phase A	Inverter is operating with an overload on phase A
Inverter Overload Phase B	Inverter is operating with an overload on phase B
Inverter Overload Phase C	Inverter is operating with an overload on phase C
Inverter Overload Time Remaining	The calculated time remaining before inverter shutdown
Inverter Shutdown - Overload	The inverter has shutdown due to a sustained overload
Inverter Static Switch SCR Short	The system has detected a short across one or more inverter static switch Silicon Controlled Rectifiers (SCR)
IP Inhibit	The intelligent paralleling operation is inhibited.
LBS Inhibited	The system has detected that conditions to perform Load Bus Sync are not satisfied
Leading Power Factor	The leading output Power Factor has fallen below a specified value
Loss of Redundancy	The multi-module collection doesn't have enough modules to redundantly support the load.
Main Battery Disconnect Forced To Unlock	The main battery disconnect is forced to the unlocked state.
Main Battery Disconnect Open	Main battery disconnect is open
Main Battery Disconnect Switch Lock Status	The main battery disconnect switch lock status.
Main Controller Fault	A Main Controller fault has been detected.
Maintenance Bypass Breaker	Maintenance bypass breaker

Table 3.163 Liebert® NXL—50Hz, CE version (Models 48 and 49)—Glossary (continued)

Data Label	Data Description
Maintenance Isolation Breaker	Maintenance isolation breaker
Maximum Auto Suspensions - ECO Mode	This setting sets the maximum number of automatic ECO Mode suspensions in a session.
MMS Event Summary	Summary of any active user alarm or fault of this module in a multi-module system
MMS Inter-Module Comm Status	Inter-module communication status of this module in a multi-module system
MMS Module Alarm Active	Active alarm or fault of any module in a multi-module system
MMS Module Inverter Status	Multi-module inverter status of this module (on/off)
MMS Module Number	MMS module number
MMS Module Output Source	Module output source in a multi-module system (normal/bypass/maintenance bypass/off)
MMS Module Output Voltage Status	Output voltage status of this module in multi-module system
MMS On Battery	The multi-module system is on battery
MMS Output Apparent Power	The sum total apparent power of all system output modules
MMS Output Frequency	The multi-module system output frequency
MMS Output Pct Apparent Pwr (kVA) Phase A	The multi-module system output apparent power on phase A as a percentage of the rated capacity
MMS Output Pct Apparent Pwr (kVA) Phase B	The multi-module system output apparent power on phase B as a percentage of the rated capacity
MMS Output Pct Apparent Pwr (kVA) Phase C	The multi-module system output apparent power on phase C as a percentage of the rated capacity
MMS Output Pct Power Phase A	The multi-module system output power on phase A as a percentage of the rated capacity
MMS Output Pct Power Phase B	The multi-module system output power on phase B as a percentage of the rated capacity
MMS Output Pct Power Phase C	The multi-module system output power on phase C as a percentage of the rated capacity
MMS Output Power Factor Phase A	The multi-module system output power factor for phase A
MMS Output Power Factor Phase B	The multi-module system output power factor for phase B
MMS Output Power Factor Phase C	The multi-module system output power factor for phase C
MMS Output Power	The sum total power of all system output modules
MMS Overload	Multi-module system overload
MMS UPS Output Source	Multi-module UPS output source
Module Output Breaker for Module 1	Module output breaker for module 1

Table 3.163 Liebert® NXL—50Hz, CE version (Models 48 and 49)—Glossary (continued)

Data Label	Data Description
Module Output Breaker for Module 2	Module output breaker for module 2
Module Output Breaker for Module 3	Module output breaker for module 3
Module Output Breaker for Module 4	Module output breaker for module 4
Module Output Breaker for Module 5	Module output breaker for module 5
Module Output Breaker for Module 6	Module output breaker for module 6
Module Output Breaker for Module 7	Module output breaker for module 7
Module Output Breaker for Module 8	Module output breaker for module 8
Module Output Breaker	Module output breaker
Multi-module System Output Voltage RMS A-B	Multi-module system output RMS voltage between phases A and B
Multi-module System Output Voltage RMS A-N	Multi-module system output RMS voltage between phase A and Neutral
Multi-module System Output Voltage RMS B-C	Multi-module system output RMS voltage between phases B and C
Multi-module System Output Voltage RMS B-N	Multi-module system output RMS voltage between phase B and Neutral
Multi-module System Output Voltage RMS C-A	Multi-module system output RMS voltage between phases C and A
Multi-module System Output Voltage RMS C-N	Multi-module system output RMS voltage between phase C and Neutral
Multiple Fan Failure	Multiple fan failure
Number of Modules in a MMS	The number of modules in a multi-module system
Number of Redundant Modules	The number of redundant modules in a multi-module collective.
Outlet Air Overtemperature Limit	The difference between the outlet air temperature and inlet air temperature exceeds a specified maximum temperature.
Output Amp Over User Limit-Phs A	The phase A output has exceeded the user amperage threshold
Output Amp Over User Limit-Phs B	The phase B output has exceeded the user amperage threshold
Output Amp Over User Limit-Phs C	The phase C output has exceeded the user amperage threshold
Output Apparent Power Rating	Output apparent power rating

Table 3.163 Liebert® NXL—50Hz, CE version (Models 48 and 49)—Glossary (continued)

Data Label	Data Description
Output Breaker	Output breaker
Output Load on Maint. Bypass	The output power is supplied by the maintenance bypass
Output Of/Uf	The output frequency has exceeded a specified range for a specified period of time.
Output Qualification Status	output qualification status
Output Real Power Rating	Output real power rating
Output Series Static Switch	output series static switch
Output Wire Configuration	Output wire configuration
Power Supply Failure	Power supply failure
Program Input Contact 01	When the signal from [Program Input Contact 01] is active the function assigned to this contact is executed.
Program Input Contact 02	When the signal from [Program Input Contact 02] is active the function assigned to this contact is executed.
Program Input Contact 03	When the signal from [Program Input Contact 03] is active the function assigned to this contact is executed.
Program Input Contact 04	When the signal from [Program Input Contact 04] is active the function assigned to this contact is executed.
Program Input Contact 05	When the signal from [Program Input Contact 05] is active the function assigned to this contact is executed.
Program Input Contact 06	When the signal from [Program Input Contact 06] is active the function assigned to this contact is executed.
Program Input Contact 07	When the signal from [Program Input Contact 07] is active the function assigned to this contact is executed.
Program Input Contact 08	When the signal from [Program Input Contact 08] is active the function assigned to this contact is executed.
Program Input Contact 09	When the signal from [Program Input Contact 09] is active the function assigned to this contact is executed.
Program Input Contact 10	When the signal from [Program Input Contact 10] is active the function assigned to this contact is executed.
Program Input Contact 11	When the signal from [Program Input Contact 11] is active the function assigned to this contact is executed.
Program Input Contact 12	When the signal from [Program Input Contact 12] is active the function assigned to this contact is executed.
Rectifier Active Filter	Rectifier input active filter configuration
Rectifier Configuration Change Request	This event indicates that the battery is not configured and PFC is not enabled.
Rectifier Failure	Rectifier failure - rectifier is off
Rectifier Input Passive Filter	Rectifier input passive filter configuration
Rectifier Passive Filter Switch	Rectifier input passive filter switch configuration
Rectifier Pulse Count	Rectifier pulse count per cycle configuration
Rectifier Status	rectifier status
Regeneration Active	Regeneration operation is active.
Regeneration Operation Failure	Regeneration operation has been terminated due to bypass source instability or unit misoperation.
Regeneration Operation Terminated	Regeneration operation is not active.
Restart Delay - ECO Mode	The time delay that the conditions to activate ECO Mode must be satisfied before ECO Mode can be reactivated during

Table 3.163 Liebert® NXL—50Hz, CE version (Models 48 and 49)—Glossary (continued)

Data Label	Data Description
	an active session.
SCC Event Summary	Summary of any active user alarms or faults on the SCC
Schedule Action - ECO Mode	This setting gives the user the ability to choose the action of a schedule entry to be either stop or start.
Schedule Day of Week - ECO Mode	This setting represents the day of the week when an associated ECO Mode schedule entry action will take effect.
Schedule Hour - ECO Mode	This setting represents the hour of the day when an associated schedule entry action will take effect.
Schedule Minute - ECO Mode	This setting represents the minute of the hour when an associated schedule entry action will take effect.
Schedule Operation State - ECO Mode	This setting gives the user the ability to either enable or disable a schedule entry if the action is Start.
Service Code Active	Service code is running
Static Bypass Switch	Static Bypass Switch state - On/Off
Static Switch Type	Static switch type configuration
Sum of MMS Output RMS Currents for Phase A	The sum of the multi-module system output RMS currents for phase A
Sum of MMS Output RMS Currents for Phase B	The sum of the multi-module system output RMS currents for phase B
Sum of MMS Output RMS Currents for Phase C	The sum of the multi-module system output RMS currents for phase C
System Breaker(s) Close Failure	One or more breakers in the system failed to close
System Breaker(s) Open Failure	One or more breakers in the system failed to open
System Controller Error	System controller internal error
System Date and Time	The system date and time
System Fan Capacity Status	System fan capacity status
System Fan Failure - Redundant	Redundant system fan failure
System Fan Redundant Status	System fan redundant status
System Fan Status	System fan status
System Input Current Imbalance	System Input Currents are Imbalanced
System Input Current Limit	The RMS input current has reached the input current limit threshold
System Input Frequency	The system input frequency
System Input Nominal Frequency	The nominal (or rated) system input frequency
System Input Nominal Voltage	The nominal (or rated) system input voltage
System Input Phs Rotation	The power conductors on the input line are not wired to the UPS in the sequence preferred for the rectifier (A-B-C)

Table 3.163 Liebert® NXL—50Hz, CE version (Models 48 and 49)—Glossary (continued)

Data Label	Data Description
Error	
System Input Power Problem	The input is not qualified to provide power to the system
System Input Power Source	System input power source
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A
System Input RMS Current Phase A	The system input RMS current for Phase A
System Input RMS Current Phase B	The system input RMS current for Phase B
System Input RMS Current Phase C	The system input RMS current for Phase C
System Isolation Output Breaker	System isolation output breaker
System Load Bank Breaker	System load bank breaker
System Output Apparent Power	The sum total apparent power of all system output phases
System Output Breaker	System output breaker
System Output Fault	A fault has been detected in the system output
System Output Frequency	The system output frequency
System Output Low Power Factor	The system output power factor is low, resulting in reduced output capacity
System Output Maximum Amp Rating	System output maximum amperage rating
System Output Nominal Frequency	The nominal (or rated) system output frequency
System Output Nominal Voltage	The nominal (or rated) system output voltage
System Output Pct Power Phase A	The system output power on phase A as a percentage of the rated capacity
System Output Pct Power Phase B	The system output power on phase B as a percentage of the rated capacity
System Output Pct Power Phase C	The system output power on phase C as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs A	The system output apparent power on phase A as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs B	The system output apparent power on phase B as a percentage of the rated capacity
System Output Pct Pwr (VA) Phs C	The system output apparent power on phase C as a percentage of the rated capacity

Table 3.163 Liebert® NXL—50Hz, CE version (Models 48 and 49)—Glossary (continued)

Data Label	Data Description
Phs C	
System Output Power Factor Phs A	The system output power factor of phase A
System Output Power Factor Phs B	The system output power factor of phase B
System Output Power Factor Phs C	The system output power factor of phase C
System Output Power	The sum total power of all system output phases
System Output RMS Current Phs A	The system output RMS current for Phase A
System Output RMS Current Phs B	The system output RMS current for Phase B
System Output RMS Current Phs C	The system output RMS current for Phase C
System Output Voltage RMS A-B	The system output RMS voltage between phases A and B
System Output Voltage RMS A-N	The system output RMS voltage between phases A and Neutral
System Output Voltage RMS B-C	The system output RMS voltage between phases B and C
System Output Voltage RMS B-N	The system output RMS voltage between phases B and Neutral
System Output Voltage RMS C-A	The system output RMS voltage between phases C and A
System Output Voltage RMS C-N	The system output RMS voltage between phases C and Neutral
System Redundant UPS Modules	Number of redundant UPS modules in the system
System Shutdown - EPO	System shutdown due to Emergency Power Off (EPO)
System Shutdown - REPO	System shutdown due to Remote Emergency Power Off (REPO)
System Status	The operating status for the system
System UPS Module Count	Number of UPS modules in the system
The main battery disconnect status.	Main Battery Disconnect Status
Time Remaining - ECO Mode	Time remaining before current active ECO Mode session stops.
Total Bypass Operating Time	The cumulative bypass time of the unit.
Total System Operating Time	The cumulative operation time of the unit
Trap Filter Disconnect	Trap filter disconnect
Unexpected Main Battery	The main battery disconnect has closed unexpectedly.

Table 3.163 Liebert® NXL—50Hz, CE version (Models 48 and 49)—Glossary (continued)

Data Label	Data Description
Disconnect Closure	
UPS Battery Status	UPS battery status
UPS Module Type	UPS module type
UPS Output on Bypass	The output power is supplied by the bypass
UPS Output Source	UPS output source
UPS System Output Source	The UPS system's output power source
VDC Backfeed	The voltage between battery and DC bus measurements is out of tolerance.

Table 3.164 Liebert® PowerSure Interactive (before July 2008)—Status and Coil

Data Description	Status	Coil	Number of Bits	Scale	Notes / Units
Audible Alarm Enabled	10002	2	1	—	—
Automatic Battery Test Enabled	10003	3	1	—	—
Battery Charge Compensation	10046		1	—	—
Inverter Ready	10047	—	1	—	—
Load Circuit 1 State	10057	—	1	—	—
Load Circuit 2 State	10058	—	1	—	—
Load Circuit 3 State	10059	—	1	—	—
Load Circuit 4 State	10060	—	1	—	—
Load Circuit 5 State	10061	—	1	—	—
Load Circuit 6 State	10062	—	1	—	—
Load Circuit 7 State	10063	—	1	—	—
Load Circuit 8 State	10064	—	1	—	—
Load Circuit 9 State	10065	—	1	—	—
Load Circuit 10 State	10066	—	1	—	—

Input Under Voltage	10188	—	1	—	—
Bad Input Frequency	10190	—	1	—	—
Output Under Voltage	10218	—	1	—	—
Output Over Voltage	10219	—	1	—	—

If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.

Table 3.165 Liebert® PowerSure Interactive (before July 2008)—Input and Holding

Data Description	Input Register	Holding Register	# of Reg.	Scale	Notes / Units
Number of Input Lines	30004	40004	1	—	Bits 12 - 15
Number of Bypass Lines	30004	40004	1	—	Bits 4 - 7
Number of Output Lines	30004	40004	1	—	Bits 8 - 11
Number of SubModules	30009	40009	1	—	-
Load Circuit Present	30013	40013	1	—	There are 16 possible Load Circuits. Each bit represents 1 load circuit. Load Circuit 1 is bit 0, Load Circuit 2 is bit 1 and so on. If the bit is 1, then the Load Circuit is supported.
Nominal Power Rating	30021	40021	2	—	VA

Table 3.165 Liebert® PowerSure Interactive (before July 2008)—Input and Holding (continued)

Data Description	Input Register	Holding Register	# of Reg.	Scale	Notes / Units
Nominal Input Voltage	30027	40027	1	—	V
Nominal Output Voltage	30028	40028	1	—	V
Nominal Input Current	30030	40030	1	—	A
Nominal Input Frequency	30031	40031	1	10	Hz
Nominal Output Frequency	30032	40032	1	10	Hz
Nominal Power Factor	30033	40033	1	100	—
Nominal Battery Voltage	30034	40034	1	—	V
Auto Restart Delay	30051	40051	1	—	Seconds
Device Low Battery Time	30053	40053	1	—	Minutes
Load (Apparent Power)	30102	—	2	—	VA
Load / Capacity	30106	—	1	—	%
Input Frequency	30107	—	1	10	Hz
Output Frequency	30108	—	1	10	Hz
Battery Charge Status	30112	—	1	—	1 - 100% Charged 2 - Less than 100% Charged 3 - Charging 4 - Discharging 5 - Float Charging 6 - Equalize Charging
Battery Voltage	30113	—	1	—	V
Battery Time Remaining	30115	—	1	—	Minutes
Battery Charge Percentage	30116	—	1	—	%
Battery Test Result	30130	—	1	—	1 - Unknown 2 - Passed 3 - Failed 4 - In Progress 5 - System Failure 7 - Inhibited
Input Voltage L1	30153	—	1	—	V
Output Voltage L1	30163	—	1	—	V
Output Current L1	30164	—	1	—	A
Input Maximum Voltage L1	30180	—	1	—	V

Table 3.165 Liebert® PowerSure Interactive (before July 2008)—Input and Holding (continued)

Data Description	Input Register	Holding Register	# of Reg.	Scale	Notes / Units
Input Minimum Voltage L1	30181	—	1	—	V
Output Maximum Voltage L1	30182	—	1	—	V
Output Minimum Voltage L1	30183	—	1	—	V
Black Out Count	30301	—	1	—	—
Brown Out Count	30302	—	1	—	—

If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.

Table 3.166 Liebert® PowerSure Interactive 2—Status and Coil; Applies only to Liebert® PSI units manufactured before June 1, 2008 (Julian date 08153)

Data Description	Status	Coil	Number of Bits	Scale	Notes/Units
Audible Alarm Enabled	10002	2	1	—	—
Automatic Battery Test Enabled	10003	3	1	—	—
DC-To-DC Converter On	10042	—	1	—	—

Table 3.170 Liebert® PSI5—Glossary

Data Label	Data Description
Abort Command	Attempt to abort a previously issued command to the device that is still pending
Audible Alarm Control	Audible Alarm Control
Auto Restart Delay	If power is lost, the control will delay this amount of time after power is restored before restarting the unit.
Auto Restart	When 'enabled', the UPS will automatically restart the load when utility power is restored after a battery discharge.
Automatic Battery Test	Enable/disable the automatic battery test schedule.
Battery Charge Status	Battery charge status.
Battery Discharge Time	The time on battery operation for this discharge
Battery Discharging	The battery is discharging
Battery Low	The calculated battery time remaining has reached the low battery threshold
Battery Over Voltage	The system has detected that the battery voltage has exceeded a predetermined limit.
Battery Percentage Charge	The percentage of battery charge
Battery Self Test	Battery self test is in progress
Battery Test Failed	Battery test failed
Battery Test Result	The outcome of the previous battery test.
Battery Time Remaining	The calculated available time on battery
Battery Under Voltage	Battery voltage is too low.
Charger Failure	Charger Failure - Charger is off
DC Bus Nominal Voltage	The nominal (or rated) voltage between the positive and negative terminals of the DC bus at the battery input
DC Bus Voltage	The voltage between the positive and negative terminals of the DC bus at the battery input
DC Converter Status	The operating state of the dc converter.
DC to DC Converter Fault	A failure has occurred in the battery discharge circuit.
Emergency Power Off - Latched	System output is off - 'Emergency Power Off (EPO) - latched' requires manual reset
Emergency Power Off (EPO) Logic	Emergency Power Off (EPO) Logic
Enable/Disable neutral grounding in battery mode	Enable/Disable neutral grounding in battery mode.
Enable/Disable non-programmable outlets	Enable/Disable non-programmable outlets
Enable/Disable programmable outlets	Enable/Disable programmable outlets.
Enable/Disable site fault detection	Enable/Disable site fault detection.
Equipment Over Temperature	Equipment over temperature summary event
Inlet Air Temperature	The temperature of the inlet air
Input Frequency Deviation	The input frequency is outside of the normal range.
Input Overvoltage	One or more of the input phase voltages has exceeded the limit.

Table 3.170 Liebert® PSI5—Glossary (continued)

Data Label	Data Description
Input Undervoltage	One or more of the input phase voltages has dropped below the limit.
Input Waveform Sensitivity	Set the sensitivity of acceptable input voltage quality.
Input Wiring Fault	The neutral/ground conductors on the input wiring are not properly bonded, or the line/neutral conductors have been swapped.
Inverter Failure	Inverter failure - inverter output is off
Low Battery Warning Time	When battery time remaining falls to, or below, this value the low battery alarm is activated.
Manual Battery Test	Command to initiate a manual battery test.
Nominal Power Factor	The nominal (or rated) system power factor.
Non-Programmable outlet time limit	Maximum time non-programmable outlets will be powered while running on battery.
Number of EBC Installed	The total number of Extended Battery Cabinets installed.
Outlet Group Identifier	A runtime assigned outlet group identification number
Outlet Group Power Control	Outlet Group Power Control
Output Apparent Power Rating	Output apparent power rating
Output On Delay	When a value is written to this point the output will be turned on after the specified time has elapsed.
Output Overload	An overload exists on the output.
Output Overvoltage	One or more of the output phase voltages has exceeded the limit.
Output Undervoltage	One or more of the output phase voltages has dropped below the limit.
Parallel Comm Warning	Parallel communication bus warning
Programmable outlet time limit	Maximum time programmable outlets will be powered while running on battery.
Reboot With Delay	When a value is written to this point the output will be turned off immediately and then turned back on after the specified time has elapsed.
Rectifier Failure	Rectifier failure - rectifier is off
Replace Battery	The battery is due for replacement.
Reset Power Statistics	Reset Power Statistics
Server Class	The general classification for this system
Shutdown After Delay	When a value is written to this point the system will shutdown after the specified time has elapsed and output will remain off.
Shutdown Pending	Shutdown is pending.
Silence Audible Alarm	Silence Audible Alarm
System Fan Failure	System fan failure - one or more fans have failed
System Input Frequency	The system input frequency
System Input Nominal Current	The nominal (or rated) system input current
System Input Nominal Frequency	The nominal (or rated) system input frequency
System Input Nominal Voltage	The nominal (or rated) system input voltage

Table 3.170 Liebert® PSI5—Glossary (continued)

Data Label	Data Description
System Input Power Problem	The input is not qualified to provide power to the system
System Input RMS Current L1	The system input RMS current for Line 1
System Input RMS L1-N	The System Input RMS Voltage between Line 1 and Neutral
System Output Apparent Power	The sum total apparent power of all system output phases
System Output Frequency	The system output frequency
System Output Nominal Frequency	The nominal (or rated) system output frequency
System Output Nominal Voltage	The nominal (or rated) system output voltage
System Output Off	The system output is off
System Output Pct Power	The system output power as a percentage of the rated capacity.
System Output Power	The sum total power of all system output phases
System Output RMS Current L1	The system output RMS current for Line 1
System Output Voltage RMS L1-N	The system output RMS voltage between Line 1 and Neutral
System Status	The operating status for the system
Unspecified General Event	One or more unspecified events active. See local unit display for further details.
UPS Battery Status	UPS battery status
UPS Output Source	UPS output source
UPS Topology	UPS Topology

SystemInfo					
System Date and Time	39998	49998	2	—	Units : Secs since Epoch(UTC)

Table 3.179 Liebert® Trinergy™ Cube—Glossary

Data Label	Data Description
Backfeed Breaker Open	The backfeed breaker is in the open position
Battery Auto Test In Progress	Automatic battery test is in progress
Battery Breaker Open	The battery circuit is open.
Battery Charging	The UPS battery is charging (battery charge percentage lower than 98)
Battery Circuit Breaker	Battery Circuit Breaker
Battery Circuit Open	Battery Circuit Open
Battery Discharge Time	The time on battery operation for this discharge
Battery Discharging	The battery is discharging
Battery Ground Fault	Battery system ground fault amperage exceeds the threshold
Battery Low	The calculated battery time remaining has reached the low battery threshold
Battery Manual Test In Progress	Manual battery test is in progress
Battery Percentage Charge	The percentage of battery charge

Table 3.179 Liebert® Trinergy™ Cube—Glossary (continued)

Data Label	Data Description
Battery Temperature for Cabinet	The battery temperature for a cabinet
Battery Test Failed	Battery test failed
Battery Test Passed	Battery test passed
Battery Time Remaining	The calculated available time on battery
Battery Under Voltage	Battery voltage is too low.
Battery Volts for Cabinet	The voltage between the positive and negative battery terminals of a battery cabinet
Booster Failure	Booster failure - boost is off
Booster On/Off State	Booster on/off state
Bypass Breaker (SBB) Open	The bypass circuit breaker (SBB) indicates that it is in the open position.
Bypass Breaker Closed	The bypass breaker is closed
Bypass Input Frequency	The bypass input frequency
Bypass Input Power Factor Phase A	The bypass input Power Factor for Phase A.
Bypass Input Power Factor Phase B	The bypass input Power Factor for Phase B.
Bypass Input Power Factor Phase C	The bypass input Power Factor for Phase C.
Bypass Input RMS Current Phase A	The bypass input RMS current for Phase A.
Bypass Input RMS Current Phase B	The bypass input RMS current for Phase B.
Bypass Input RMS Current Phase C	The bypass input RMS current for Phase C.
Bypass Input Voltage Fault	The system has detected the bypass voltage is unqualified.
Bypass Input Voltage RMS A-B	The bypass input RMS voltage between phases A and B
Bypass Input Voltage RMS A-N	The bypass input RMS voltage between phase A and Neutral
Bypass Input Voltage RMS B-C	The bypass input RMS voltage between phases B and C
Bypass Input Voltage RMS B-N	The bypass input RMS voltage between phase B and Neutral
Bypass Input Voltage RMS C-A	The bypass input RMS voltage between phases C and A
Bypass Input Voltage RMS C-N	The bypass input RMS voltage between phase C and Neutral
Bypass Not Available	A problem associated with the bypass has been detected

Table 3.179 Liebert® Trinergy™ Cube—Glossary (continued)

Data Label	Data Description
Bypass out of sync	Bypass and Inverter inputs are not in sync
Bypass Overload	Bypass overloaded, reduce load immediately.
Bypass Power Phase A	The bypass power on phase A
Bypass Power Phase B	The bypass power on phase B
Bypass Power Phase C	The bypass power on phase C
Bypass Qualification	Status bypass qualification status
Bypass Static Switch Unavailable	The static bypass is unavailable to support the critical load.
Bypass Status	Bypass Status
Charger Failure	Charger Failure - Charger is off
Charger On/Off State	Charger on/off state
Charger Status	Charger Status
DC Bus Abnormal	The system has detected an abnormal DC Bus Voltage.
DC Bus Current	The current at the battery input terminals. In charging mode, the current will be a positive value. In discharging mode, the current will be a negative value
ECO Mode Operation State	This setting is used to enable or disable ECO Mode.
Equipment Over Temperature	Equipment over temperature summary event
Fuse Failure	A summary event indicating one or more fuse failures
General Fault	A general fault in the UPS has been detected.
General Warning	A warning in the UPS has been detected.
Ground Fault	An AC phase to ground fault or three phase fault to ground exists on the output of the UPS.
Input Breaker Open	The main input breaker is open.
Inverter Failure	Inverter failure - inverter output is off
Inverter Overload	Inverter in overload fault
Inverter Status	Inverter Status
Maintenance Bypass Breaker Closed	The maintenance bypass breaker is closed.
Maintenance Isolation Breaker	Maintenance isolation breaker
On Generator	A generator is supplying the power to the system
Output Apparent Power Rating	Output apparent power rating
Output Breaker Open	The output breaker is open.
Output Off Pending	Output off pending - shutdown imminent.
Outside Air Temperature	Ambient outside air temperature.

Table 3.179 Liebert® Trinergy™ Cube—Glossary (continued)

Data Label	Data Description
QS1 Breaker	QS1 Breaker
QS4 Breaker	QS4 Breaker
Rectifier Failure	Rectifier failure - rectifier is off
Rectifier Status	Rectifier Status
Static Bypass Switch	Static Bypass Switch state - On/Off
Static Switch Input Breaker	Static Switch Input Breaker
System Date and Time	The system date and time
System Fan Failure	System fan failure - one or more fans have failed
System Input Frequency	The system input frequency
System Input Nominal Current	The nominal (or rated) system input current
System Input Nominal Frequency	The nominal (or rated) system input frequency
System Input Nominal Voltage	The nominal (or rated) system input voltage
System Input Power Phase A	The system input power on phase A
System Input Power Phase B	The system input power on phase B
System Input Power Phase C	The system input power on phase C
System Input Power Problem	The input is not qualified to provide power to the system
System Input RMS A-B	The System Input RMS Voltage between Phase A and Phase B
System Input RMS A-N	The System Input RMS Voltage between Phase A and Neutral
System Input RMS B-C	The System Input RMS Voltage between Phase B and Phase C
System Input RMS B-N	The System Input RMS Voltage between Phase B and Neutral
System Input RMS C-A	The System Input RMS Voltage between Phase C and Phase A
System Input RMS C-N	The System Input RMS Voltage between Phase C and Neutral
System Input RMS Current Phase A	The system input RMS current for Phase A
System Input RMS Current Phase B	The system input RMS current for Phase B
System Input RMS Current Phase C	The system input RMS current for Phase C
System Load Bank Breaker	System load bank breaker
System Output Apparent Power Phs A	System output apparent power on phase A
System Output Apparent Power Phs B	System output apparent power on phase B
System Output Apparent Power Phs C	System output apparent power on phase C

Table 3.179 Liebert® Trinergy™ Cube—Glossary (continued)

Data Label	Data Description
System Output Fault	A fault has been detected in the system output
System Output Frequency	The system output frequency
System Output Nominal Frequency	The nominal (or rated) system output frequency
System Output Nominal Voltage	The nominal (or rated) system output voltage
System Output Off	The system output is off
System Output Pct Power Phase A	The system output power on phase A as a percentage of the rated capacity
System Output Pct Power Phase B	The system output power on phase B as a percentage of the rated capacity
System Output Pct Power Phase C	The system output power on phase C as a percentage of the rated capacity
System Output Power Factor Phs A	The system output power factor of phase A
System Output Power Factor Phs B	The system output power factor of phase B
System Output Power Factor Phs C	The system output power factor of phase C
System Output Power Phase A	The system output power on phase A.
System Output Power Phase B	The system output power on phase B.
System Output Power Phase C	The system output power on phase C.
System Output RMS Current Phs A	The system output RMS current for Phase A
System Output RMS Current Phs B	The system output RMS current for Phase B
System Output RMS Current Phs C	The system output RMS current for Phase C
System Output Voltage RMS A-B	The system output RMS voltage between phases A and B
System Output Voltage RMS A-N	The system output RMS voltage between phases A and Neutral
System Output Voltage RMS B-C	The system output RMS voltage between phases B and C
System Output Voltage RMS B-N	The system output RMS voltage between phases B and Neutral
System Output Voltage RMS C-A	The system output RMS voltage between phases C and A

Table 3.179 Liebert® Trinergy™ Cube—Glossary (continued)

Data Label	Data Description
System Output Voltage RMS C-N	The system output RMS voltage between phases C and Neutral
System Restart Pending	A request for UPS restart has been received
System Shutdown - EPO	System shutdown due to Emergency Power Off (EPO)
System Status	The operating status for the system
UPS DC input voltage	The voltage between the positive and negative terminals of the DC bus.
UPS input apparent power	The magnitude of the present input apparent power (calculated on the 3 phases).
UPS input real power	The magnitude of the present input true power (calculated on the 3 phases).
UPS manufacturer	The company manufacturing this specific UPS
UPS Module Type	UPS module type
UPS Operating Mode	UPS Operating Mode
UPS Output on Bypass	The output power is supplied by the bypass
UPS Output Source	UPS output source

3.4 Battery Monitoring Products—Modbus Protocols

Table 3.180 Alber™ BDSU—Status and Coil

Data Description	Status	Coil	Number of Bits	Notes / Units
Battery Entity				
Battery Discharging Battery 1 - 32	10001-10032		1	Active on Alarm
String Entity				
High Ambient Temperature String 1 - 32	10033-10064		1	Active on Alarm
Low Ambient Temperature String 1 - 32	10065-10096		1	Active on Alarm
Low Ambient Temperature Probe Two String 1 - 32	10097-10128		1	Active on Alarm
High Ambient Temperature Probe Two String 1 - 32	10129-10160		1	Active on Alarm
Low Overall Voltage String 1 - 32	10161-10192		1	Active on Alarm
High Overall Voltage String 1 - 32	10193-10224		1	Active on Alarm
High Battery String Current	10225-10256		1	Active on Alarm

Table 3.180 Alber™ BDSU—Status and Coil (continued)

Data Description	Status	Coil	Number of Bits	Notes / Units
String 1 - 32				
Low Battery String Float Current String 1 - 32	10257-10288		1	Active on Alarm
High Battery String Float Current String 1 - 32	10289-10320		1	Active on Alarm
High Battery String Ripple Current String 1 - 32	10321-10352		1	Active on Alarm
Maximum Discharge Time Exceeded String 1 - 32	10385-10416		1	Active on Alarm
Discharge Low Overall Voltage String 1 - 32	10417-10448		1	Active on Alarm
Discharge Low Cell Voltage String 1 - 32	10449-10480		1	Active on Alarm
Discharge High Battery String Current String 1 - 32	10481-10512		1	Active on Alarm
Excessive Cell to Cell Temperature Deviation String 1 - 32	10513-10544		1	Active on Alarm
Excessive Cell to Ambient Temperature Deviation String 1 - 32	10545-10576		1	Active on Alarm
Thermal Runaway Detected String 1 - 32	10577-10608		1	Active on Alarm
Battery String Equalize String 1 - 32	10609-10640		1	Active on Alarm
Battery String Offline String 1 - 32	10641-10672		1	Active on Alarm
Thermal Runaway Cell to Ambient Temperature Event String 1 - 32	13233-13264		1	Active on Alarm
Thermal Runaway Cell to Cell Temperature Event String 1 - 32	13265-13296		1	Active on Alarm
Thermal Runaway Charger Current Level One Event String 1 - 32	13297-13328		1	Active on Alarm
Thermal Runaway Charger Current Level Two Event String 1 - 32	13329-13360		1	Active on Alarm
Cell Entity (Cells 1 – 320)				
Low Cell Voltage	10673-10992		1	Active on Alarm

Table 3.180 Alber™ BDSU—Status and Coil (continued)

Data Description	Status	Coil	Number of Bits	Notes / Units
Cell 1 - 320				
High Cell Voltage Cell 1 - 320	10993-11312		1	Active on Alarm
Low Cell Temperature Cell 1 - 320	11313-11632		1	Active on Alarm
High Cell Temperature Cell 1 - 320	11633-11952		1	Active on Alarm
Low Internal Resistance Cell 1 - 320	11953-12272		1	Active on Alarm
High Internal Resistance Cell 1 - 320	12273-12592		1	Active on Alarm
High Intercell Resistance Cell 1 - 320	12593-12912		1	Active on Alarm
Discharge Low Cell Voltage Cell 1 - 320	12913-13232		1	Active on Alarm
Intertier Resistance High Cell 1 - 320	13361-13680		1	Active on Alarm
Cell Entity (Cells 321 – 360)				
Low Cell Voltage Cell 321 - 360	13681-13720		1	Active on Alarm
High Cell Voltage Cell 321 - 360	13721-13760		1	Active on Alarm
Low Cell Temperature Cell 321 - 360	13761-13800		1	Active on Alarm
High Cell Temperature Cell 321 - 360	13801-13840		1	Active on Alarm
Low Internal Resistance Cell 321 - 360	13841-13780		1	Active on Alarm
High Internal Resistance Cell 321 - 360	13881-13920		1	Active on Alarm

Table 3.180 Alber™ BDSU—Status and Coil (continued)

Data Description	Status	Coil	Number of Bits	Notes / Units
High Intercell Resistance Cell 321 – 360	13921-12860		1	Active on Alarm
Discharge Low Cell Voltage Cell 321 – 360	13961-14000		1	Active on Alarm
Intertier Resistance High Cell 321 - 360	14001-14040		1	Active on Alarm

If the Scale column has a value for a Data Description, divide the Modbus value by the value in the Scale column to get the scaled value.					

Table 3.182 Alber™ BDSU - Glossary

Data Label	Data Description
Battery String Status Summary	Summary status of the battery string
Discharge State	An indication that the system load is being driven by the batteries (Active), is in a normalization state (Normalization), or is in an inactive discharge state (Inactive)
Maintenance Mode Status	An indication of whether the system is undergoing maintenance.
Resistance Test State	An indication that the system is performing a resistance test (Active), is in a normalization state at completion of the resistance test (Normalization), or is operating in a nominal state (Inactive) after completion of the resistance test and the normalization period.
String Resistance Test Contact	Control of the resistance test on a String (start/stop).

3.5 Leak Detection – Modbus Protocols

Table 3.183 Liebert® Liqui-tect™ LP3000 Output Registers

Controller		LP3000			
Liebert Products		Liebert Liqui-tect LP6000 Leak-Detection System			
Available Points					
Name	Register	Description	Units	Range	Notes
Leak Threshold	40001	Trip current for leak alarm.	25-295 uAmps	0-65535	—
Contamination Threshold	40002	Trip current for contamination alarm.	20-295 uAmps	0-65535	—
Re-Alarm Delay	40003	The time that elapses between when an alarm is detected and when it is annunciated.	0-24 Hours	0-65535	—
Latching Alarms	40004	Designate the alarms as latching or non-latching.	0=No, 1=Yes	0-65535	—
Silence Audible Alarm	40005	Silence the audible alarm	1=Silenced	0-65535	—
Reset Alarms	40006	Reset all the alarms	1=Reset	0-65535	—
